## Cloudera CDP Data Engineer - Certification Exam Sample Questions (Q266-Q271):

### NEW QUESTION # 266

You need to design a DAG that can be easily triggered based on external events or data availability. How can you achieve this functionality?

- A. Implement custom code within the DAG to actively check for external events or data availability.
- B. Utilize Airflow sensors like FileSensor or S3KeySensor to wait for specific conditions before triggering the DAG.
- C. Schedule the DAG to run continuously at a fixed interval.
- D. Rely on manual intervention to trigger the DAG whenever necessary.

**Answer: B**

#### NEW QUESTION # 267

You are setting up a Spark Driver pod in Kubernetes and need to specify resource requests and limits. Which of the following configurations ensures that the Spark Driver has at least 1 CPU and 1 Gi of memory but can use up to 2 CPUs and 2 Gi of memory if available?

□

- **A. Option B**
- B. Option C
- C. Option A
- D. Option D

**Answer: A**

Explanation:

In Kubernetes, the 'requests' field defines the minimum resources required by the container, while 'limits' specify the maximum resources that the container can consume. Option B correctly sets these values.

#### NEW QUESTION # 268

Which Spark configuration parameter should be increased to improve performance when dealing with large broadcast variables?

- A. spark.executor.memory
- B. spark.broadcast.blockSize
- C. spark.default.parallelism
- **D. spark.driver.memory**

**Answer: D**

Explanation:

When using large broadcast variables, increasing the spark.driver.memory is beneficial because the driver needs sufficient memory to store the broadcast variables before they are sent to executors. Broadcast variables are sent from the driver to all executors, and having insufficient driver memory could lead to out-of-memory errors or performance bottlenecks. spark.executor.memory affects executor memory size, spark.broadcast.blockSize is not a valid Spark configuration parameter, and spark.default.parallelism affects the default number of partitions in RDDs, but not the handling of broadcast variables.

#### NEW QUESTION # 269

In Apache Airflow, how does the "catchup" parameter in a DAG definition influence the scheduling of DAG runs when backfilling data?

- A. It forces Airflow to ignore the start\_date and schedule the DAG run immediately.
- B. It limits the number of backfilled DAG runs to the most recent execution interval only.
- C. It disables backfilling entirely, ensuring that only future DAG runs are executed.
- **D. It enables backfilling, causing Airflow to schedule DAG runs for all intervals between the DAG's start\_date and the current date.**

**Answer: D**

Explanation:

The "catchup" parameter, when set to True (which is the default), tells Airflow to backfill DAG runs for all the intervals between the DAG's start\_date and the current date or end\_date if specified. Setting "catchup" to False prevents Airflow from performing this backfilling, causing it to schedule DAG runs only for intervals after the DAG's start\_date that have not yet occurred.

#### NEW QUESTION # 270

Which operator or feature in Apache Airflow can be used to dynamically adjust the schedule of data quality checks based on the volume of incoming data?

- A. The Scheduler component with dynamic DAG generation
- B. The BranchPythonOperator to choose between different scheduling paths
- C. The ExternalTaskSensor to trigger data quality checks based on external events
- D. A custom PythonOperator that modifies the DAG's schedule interval

**Answer: A**

Explanation:

While Airflow's scheduling is generally static, dynamic DAG generation techniques can be used to adjust the scheduling of tasks based on external factors, such as data volume. This can involve writing custom logic within the DAG file to modify its schedule interval or trigger conditions, potentially using external signals or data to inform these adjustments.

## NEW QUESTION # 271
