問題 #150

Refer to the exhibit.

A Mule application is deployed to a multi-node Mule runtime cluster. The Mule application uses the Competing Consumers pattern among its cluster replicas to receive JMS messages from a JMS queue. To process each received JMS message, the following steps are performed in a flow. Step 1: The JMS Correlation ID header is read from the received JMS message. Step 2: The Mule application invokes an idempotent SOAP web service over HTTPS, passing the JMS Correlation ID as one parameter in the SOAP request. Step 3: The response from the SOAP web service also returns the same JMS Correlation ID. Step 4: The JMS Correlation ID received from the SOAP web service is validated to be identical to the JMS Correlation ID received in Step 1. Step 5: The Mule application creates a response JMS message, setting the JMS Correlation ID message header to the validated JMS Correlation ID and publishes that message to a response JMS queue. Where should the Mule application store the JMS Correlation ID values received in Step 1 and Step 3 so that the validation in Step 4 can be performed and the overall Mule application can be highly available, fault-tolerant, performant, and maintainable?

- A. Both Correlation ID values should be stored as Mule event variables or attributes
- B. Both Correlation ID values should be stored in a nonpersistent Object Store
- C. The Correlation ID value in Step 1 should be stored in a persistent Object Store The Correlation ID value in Step 3 should be stored as Mule event variables or attributes
- D. Both Correlation ID values should be stored in a persistent Object Store

答案： A

問題 #151

Which of these practices should be avoided to maintain secure edge access in Mule applications using Anypoint Security (Choose Two)

- A. Relaxing firewall rules to ensure uninterrupted service availability.
- B. Enforcing encryption at the edge before data enters the network.
- C. Using multifactor authentication for device and user verification.
- D. Implementing generic security policies that are not tailored to specific business needs.

答案： A,D

問題 #152

What is the primary benefit of designing integration solutions with event-driven APIs and message brokers?

- A. Centralizing all application logic into a single process.
- B. Ensuring all components are tightly coupled.
- C. Reducing the flexibility of the integration solution.
- D. Facilitating low-latency and high-throughput communication.

答案： D

問題 #153

An MUnit case is written for a Main Flow that consists of a Listener, a set payload, a set variable, a Transform message, and a logger and error handler. The case is passed but with a coverage of 80 percent.

What could be the reason for not covering the remaining 20 percent, and how can coverage be achieved?

- A. The error handler; use error handler in MUnit test suite
- B. The Listener; send a dummy payload in MUnit test suite
- C. The Listener; use Mock when in MUnit test suite
- D. The error handler; use Mock when in MUnit test suite

答案： A

問題 #154

An external web UI application currently accepts occasional HTTP requests from client web browsers to change (insert, update, or delete) inventory pricing information in an inventory system's database. Each inventory pricing change must be transformed and then synchronized with multiple customer experience systems in near real-time (in under 10 seconds).

New customer experience systems are expected to be added in the future. The database is used heavily and limits the number of SELECT queries that can be made to the database to 10 requests per hour per user.

How can inventory pricing changes synchronize with the various customer experience systems in near real-time using an integration mechanism that is scalable, decoupled, reusable, and maintainable?

- A. Replace the external web UI application with a Mule application to accept HTTP requests from client web browsers.
- B. Write a Mule application with a Database On Table Row event source configured for the inventory pricing database, with the ID attribute set to an appropriate database column.
- C. Add a trigger to the inventory-pricing database table so that for each change to the inventory pricing database, a stored procedure is called that makes a REST call to a Mule application.
- D. Write a Mule application with a Database On Table Row event source configured for the inventory pricing database, with the watermark attribute set to an appropriate database column.

答案： C
