New Deep-Security-Professional Test Preparation, Updated Deep-Security-Professional Demo
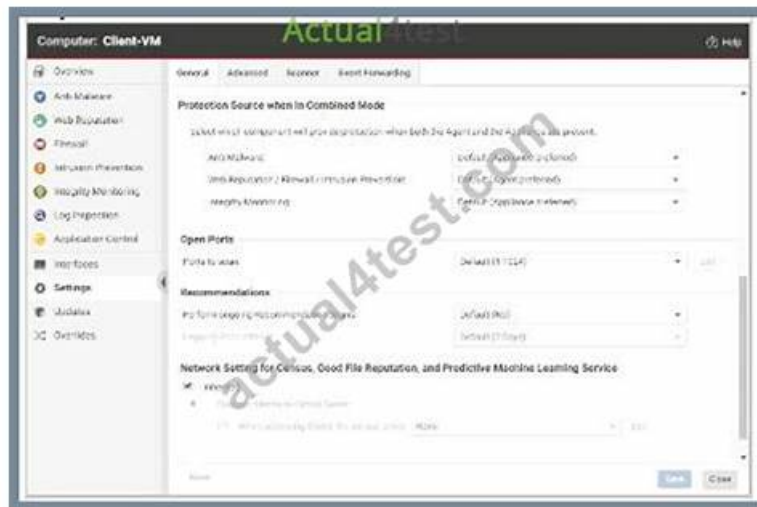

The pass rate is 98.95% for the Deep-Security-Professional training materials, and most candidates can pass the exam just one time. We ensure you that you will refund your money if you fail to pass the exam. In addition, we offer you free update for one year, and the update version for the Deep-Security-Professional exam dumps will be sent to your email automatically, so that you can know the latest information about the Deep-Security-Professional Exam Dumps. We provide you with the online chat service, and in the process of learning, if you have any questions about the Deep-Security-Professional exam dumps, you can consult us.

Trend Micro Certified Professional for Deep Security exam covers a variety of topics related to the Deep Security product, including installation, configuration, and management of the product. It also covers topics related to the security features of the product, such as intrusion prevention, anti-malware, and virtual patching. Deep-Security-Professional Exam is designed to test an individual's knowledge of these topics and their ability to apply that knowledge in real-world scenarios.

Deep-Security-Professional Exam Questions Available At High Discount With Free Demo

Some people prefer books, some check videos, and some hire online tutors, to clear the Deep-Security-Professional exam. It all depends on you what you like the most. If you learn better by books, go for it but if you are busy, and don't have much time to consult a list of books for studying, it's better to get the most probable Trend Micro Certified Professional for Deep Security (Deep-Security-Professional) exam questions. We are sure that you will learn well and can crack Trend Deep-Security-Professional exam easily.

Trend Micro Certified Professional for Deep Security Sample Questions (Q81-Q86):

NEW QUESTION # 81
Which of the following is not an operation that is performed when network traffic is intercepted by the network driver on the Deep Security Agent?

- A. Compare the data in the packet against the Anti-Malware Scan Configuration to verify whether any of the data related to files and folders on the Exclusion list.
- B. Verify the integrity of the packet to insure the packet is suitable for analysis.
- C. Analyze the packet within the context of traffic history and connection state.
- D. Verify the packet is not part of a reconnaissance scan used to discover weaknesses on the Deep Security Agent host

computer.

Answer: A

NEW QUESTION # 82
The maximum disk space limit for the Identified Files folder is reached. What is the expected Deep Security Agent behavior in this scenario?

- A. Deep Security Agents will delete any files that have been in the folder for more than 60 days.
- B. Files will no longer be able to be quarantined. Any new files due to be quarantined will be deleted instead.
- C. Deep Security Agents will delete the oldest files in this folder until 20% of the allocated space is available.
- D. Any existing files are in the folder are compressed and forwarded to Deep Security Manager to free up disk space.

Answer: C

Explanation:
If the limit is reached, the oldest files will be deleted first until 20% of allocated space is freed up.
Explication: Study Guide - page (203)

NEW QUESTION # 83
What is the purpose of the Deep Security Notifier?

- A. The Deep Security Notifier is a server component used in agentless configurations to allow Deep Security Manager to notify managed computers of pending updates.
- B. The Deep Security Notifier is a application in the Windows System Tray that displays the Status of Deep Security Manager during policy and software updates.
- C. The Deep Security Notifier is a application in the Windows System Tray that com-municates the state of Deep Security Agents and Relays to endpoint computers.
- D. The Deep Security Notifier is a server components that collects log entries from man-aged computers for delivery to a configured SIEM device.

Answer: C

Explanation:
The Deep Security Notifier is a Windows System Tray application which provides local notification when malware is detected or malicious URLs are blocked.
It may be installed separately on protected virtual machines, however the Anti-Malware Protection Module must be licensed and enabled on the virtual machine for the Deep Security Notifier to display information.
The Notifier displays pop-up user notifications when the Anti-Malware module begins a scan, or blocks malware or access to malicious web pages. The Notifier also provides a console utility that allows the user to view events.
Explication: Study Guide - page (442)

NEW QUESTION # 84
Which of the following is NOT an operation that can be performed on Deep Security resources using the API?

- A. VIEW
- B. POST
- C. GET
- D. PUT

Answer: A

Explanation:
Trend Micro Deep Security APIs use standard RESTful operations:
GET (retrieve resource)
POST (create resource)
PUT (update resource)
DELETE (remove resource)

"VIEW" is not a standard HTTP method nor an operation in the Deep Security API context.
From the official documentation:
"The Deep Security API supports standard HTTP methods for interacting with resources: GET, POST, PUT, and DELETE."

NEW QUESTION # 85

The Intrusion Prevention Protection Module is enabled, its Behavior is set to Prevent and rules are assigned.
When viewing the events, you notice that one of Intrusion Prevention rules is being triggered and an event is being logged but the traffic is not being blocked. What is a possible reason for this?

- A. The default Prevention Behavior in this particular rule may be set to Detect. This logs the triggering of the rule, but does not actually enforce the block.
- B. The network engine is running in Inline mode. In Inline mode, Deep Security provides no protection beyond a record of events.
- C. The Intrusion Prevention rule is being triggered as a result of the packet sanity check failing and the packet is being allowed to pass.
- D. The Deep Security Agent is experiencing a system problem and is not processing packets since the "Network Engine System Failure" mode is set to "Fail Open".

Answer: A

Explanation:
If the Intrusion Prevention rule's behavior is set to Detect rather than Prevent, it will log events when the rule is triggered but will not block the associated traffic. This can happen even if the module's overall setting is Prevent, because individual rules can have their own behavior configuration.
