CompTIA Cloud+ (CV0-004) Certification Exam Sample Questions (Q206-Q211):

NEW QUESTION # 206

A cloud engineer is collecting web server application logs to troubleshoot intermittent issues. However, the logs are piling up and causing storage issues. Which of the following log mechanisms should the cloud engineer implement to address this issue?

- A. Sampling
- **B. Rotation**
- C. Splicing
- D. Inspection

Answer: B

Explanation:

Log rotation is the mechanism the cloud engineer should implement to address the issue of logs piling up and causing storage issues. Log rotation involves automatically archiving old log files and creating new ones after a certain size or time period, preventing storage issues. NEW QUESTION # 207

A cloud engineer is receiving multiple alerts from the infrastructure monitoring agent. The alerts state that all the VMs in the public subnet are at 100% CPU utilization. However, when the engineer checks the network utilization of the VMs, the network throughput is at normal levels. Which of the following is the most likely cause of this issue?

- A. Ransomware
- **B. Cryptojacking**
- C. DDoS
- D. Zombie instances

Answer: B

Explanation:

- * A. Ransomware: Encrypts data to demand payment but doesn't typically result in sustained high CPU utilization.
- * **B. Cryptojacking: Involves unauthorized use of VMs to mine cryptocurrency, leading to 100% CPU usage without high network activity.**
- * C. DDoS: Causes high network throughput and latency, which are not present in this scenario.
- * D. Zombie instances: Refers to unused VMs consuming resources unnecessarily but doesn't explain high CPU utilization.

NEW QUESTION # 208

An e-commerce store is preparing for an annual holiday sale. Previously, this sale has increased the number of transactions between two and ten times the normal level of transactions. A cloud administrator wants to implement a process to scale the web server seamlessly. The goal is to automate changes only when necessary and with minimal cost. Which of the following scaling approaches should the administrator use?

- A. When traffic increases, adjust the resources using the cloud portal.
- B. Scale horizontally with additional web servers to provide redundancy.
- **C. Allow the load to trigger adjustments to the resources.**
- D. Schedule the environment to scale resources before the sale begins.

Answer: C

Explanation:

To seamlessly scale the web server for an e-commerce store during an annual sale, it's best to allow the load to trigger adjustments to the resources. This approach uses autoscaling to automatically adjust the number of active servers based on the current load, ensuring an automated change that is cost-effective.

NEW QUESTION # 209

A cloud administrator needs to distribute workloads across remote data centers for redundancy reasons. Which of the following deployment strategies would eliminate downtime, accelerate deployment, and remain cost efficient?

- **A. Blue-green**
- B. Rolling
- C. Canary
- D. In-place

Answer: A

Explanation:

Blue-green deployment is the strategy that can eliminate downtime, accelerate deployment, and remain cost-efficient. It involves running two identical production environments, only one of which is live at any given time (blue or green). When it's time to deploy, the new version is released to the inactive environment (green), which is then thoroughly tested. Once ready, the traffic is switched over, making the green environment live.

NEW QUESTION # 210

A cloud engineer is designing a cloud-native, three-tier application. The engineer must adhere to the following security best practices:

- * Minimal services should run on all layers of the stack.
- * The solution should be vendor agnostic.
- * Virtualization could be used over physical hardware.

Which of the following concepts should the engineer use to design the system to best meet these requirements?

- **A. Micro services**
- B. Fan-out
- C. Virtual machine
- D. Cloud-provided managed services

Answer: A

Explanation:

Microservices architecture is the most suitable design principle that aligns with the security best practices mentioned. It involves developing a suite of small services, each running in its own process and communicating with lightweight mechanisms, often an HTTP resource API. This architecture minimizes the services running on each layer, allows for vendor-agnostic solutions, and is well-suited for virtualization over physical hardware.

Microservices as an architectural approach is discussed in the context of cloud-native applications within the CompTIA Cloud+ material.
