Splunk Core Certified Power User Exam 認定 SPLK-1002 試験問題 (Q299-Q304):

質問 # 299

Which of the following statements about tags is true?

- A. Tags are case insensitive.
- B. Tags are created at index time.
- C. Tags are searched by using the syntax tag : <fieldname>
- **D. Tags can make your data more understandable.**

正解: D

質問 # 300

There are several ways to access the field extractor. Which option automatically identifies data type, source type, and sample event?

- A. Settings > Field Extractions > New Field Extraction
- B. Event Actions > Extract Fields
- **C. Fields sidebar > Extract New Field**
- D. Settings > Field Extractions > Open Field Extraction

正解: C

解説:

Explanation

There are several ways to access the field extractor. The option that automatically identifies data type, source type, and sample event is Fields sidebar > Extract New Field. The field extractor is a tool that helps you extract fields from your data using delimiters or regular expressions. The field extractor can generate a regex for you based on your selection of sample values or you can enter your own regex in the field extractor. The field extractor can be accessed by using various methods, such as:

Fields sidebar > Extract New Field: This is the easiest way to access the field extractor. The fields sidebar is a panel that shows all available fields for your data and their values. When you click on Extract New Field in the fields sidebar, Splunk will automatically identify the data type, source type, and sample event for your data based on your current search criteria. You can then use the field extractor to select sample values and generate a regex for your new field.

Event Actions > Extract Fields: This is another way to access the field extractor. Event actions are actions that you can perform on individual events in your search results, such as viewing event details, adding to report, adding to dashboard, etc. When you click on Extract Fields in the event actions menu, Splunk will use the current event as the sample event for your data and ask you to select the source type and data type for your data. You can then use the field extractor to select sample values and generate a regex for your new field.

Settings > Field Extractions > New Field Extraction: This is a more advanced way to access the field extractor. Settings is a menu that allows you to configure various aspects of Splunk, such as indexes, inputs, outputs, users, roles, apps, etc. When you click on New Field Extraction in the Settings menu, Splunk will ask you to enter all the details for your new field extraction manually, such as app context, name, source type, data type, sample event, regex, etc. You can then use the field extractor to verify or modify your regex for your new field.

質問 # 301

Consider the following search:

`index=web sourcetype=access_combined`

The log shows several events that share the same jsessionid value (SD462K101O2F267). View the events as a group.

From the following list, which search groups events by jSESSIONID?

- A. `index=web sourcetype=access_combined JSESSIONID <SD462K101O2F267>`
- B. `index=web sourcetype=access_combined | highlight JSESSIONID | search SD462K101O2F267`
- C. `index=web sourcetype=access_combined SD462K101O2F267 | table JSESSIONID`
- **D. `index=web sourcetype=access_combined | transaction JSESSIONID | search SD462K101O2F267`**

正解: D

解説:

The transaction command groups events that share a common value in a specified field, such as JSESSIONID, and that occur within a specified time range. The search command filters the results to show only the events that match the given value of JSESSIONID. This search groups the events by JSESSIONID and then shows only the events that have the value SD462K101C2F267 for JSESSIONID2

1: Splunk Core Certified Power User Track, page 9. 2: Splunk Documentation, transaction command.

質問 # 302

Which delimiters can the Field Extractor (FX) detect? (select all that apply)

- A. Pipes
- B. Commas
- C. Spaces
- D. Tabs

正解: A、B、C

解説:

Reference: <https://docs.splunk.com/Documentation/Splunk/8.0.3/Knowledge/FXSelectMethodstep>

質問 # 303

Given the macro definition below, what should be entered into the Name and Arguments fields to correctly configure the macro?

□

- A. The macro name is sessiontracker and the arguments are \$action\$, \$JSESSIONID\$.
- B. The macro name is sessiontracker(2) and the arguments are action, JSESSIONID.
- C. The macro name is sessiontracker and the arguments are action, JSESSIONID.
- D. The macro name is sessiontracker(2) and the arguments are \$action\$, \$JSESSIONID\$.

正解: B

解説:

Reference: <https://docs.splunk.com/Documentation/Splunk/8.0.3/Knowledge/DefineSearchMacros> The macro definition below shows a macro that tracks user sessions based on two arguments: action and JSESSIONID.

sessiontracker(2)

The macro definition does the following:

It specifies the name of the macro as sessiontracker. This is the name that will be used to execute the macro in a search string.

It specifies the number of arguments for the macro as 2. This indicates that the macro takes two arguments when it is executed.

It specifies the code for the macro as `index=main sourcetype=access_combined_wcookie action=$action$`

`JSESSIONID=$JSESSIONID$ | stats count by JSESSIONID`. This is the search string that will be run when the macro is

executed. The search string can contain any part of a search, such as search terms, commands, arguments, etc. The search string can also include variables for the arguments using dollar signs around them.

In this case, action and JSESSIONID are variables for the arguments that will be replaced by their values when the macro is executed.

Therefore, to correctly configure the macro, you should enter sessiontracker as the name and action, JSESSIONID as the arguments. Alternatively, you can use sessiontracker(2) as the name and leave the arguments blank.
