NEW QUESTION # 77

A cloud native project is being worked on in which all source code and dependencies are written in Python, Ruby, and/or JavaScript. A change in code triggers a notification to the CI/CD tool to run the CI/CD pipeline.

Which step should be omitted from the pipeline?

- A. Deploy the code to one or more environments, such as staging and/or production.
- B. Build one or more containers that package up code and all its dependencies.
- C. Run automated tests to validate the correctness.
- D. Compile code.

Answer: D

Explanation:

In the building phase, the code is compiled for languages such as Java, C/C++, or Go; for code written in interpreted languages such as Ruby or Python, the compilation step can be ignored.

NEW QUESTION # 79

The response from a server includes the header ETag:

W/"7eb8b94419e371767916ef13e0d6e63d". Which statement is true?

- A. The ETag has a Weak validator directive, which is an optional directive.
- B. The ETag has a Weak validator directive, which is a mandatory directive.
- C. The ETag has a Strong validator directive, which it is incorrectly formatted.
- D. The ETag has a Strong validator directive.

Answer: A

Explanation:

'W' (case-sensitive) indicates that a weak validator is used which is optional. Weak etags are easy to generate, but are far less useful for comparisons. Strong validators are ideal for comparisons but can be very difficult to generate efficiently. Weak ETag values of two representations of the same resources might be semantically equivalent, but not byte-for-byte identical. This means weak etags prevent caching when byte range requests are used, but strong etags mean range requests can still be cached.
