問題 #89

A data analyst is working with JSON data representing product reviews. The JSON structure is complex, containing nested arrays and objects. The analyst needs to extract all the reviewer names (reviewer_name) who gave a rating greater than 4, along with the product ID (product_id) and the overall average rating of that specific product. The table 'RAW REVIEWS' contains a single VARIANT column named holding the JSON data'. Choose the most efficient and correct Snowflake SQL query to achieve this. Assume the JSON structure is consistent across all rows.

- A. Option D
- B. Option C

- C. Option B
- D. Option A
- E. Option E

答案： B

解題說明：

Option C correctly uses LATERAL FLATTEN to unnest the 'reviews' array within the JSON. It accurately extracts 'reviewer_name' and 'rating' from the flattened array 'r'. Critically, it correctly retrieves directly from the 'raw_json' column as the product ID is not within the nested 'reviews' array, but at the root level. The average rating is correctly calculated using a window function partitioned by the product_id in the flatten table. Option A incorrectly references the product_id in the flatten table. Option B is inefficient and incorrect because it assumes only one review exists ([0]) and uses GET PATH, which is less performant than direct path access. Option D is also incorrect for average rating as raw_json:reviews[0].rating will pick only the first rating in JSON to derive avg_rating.

問題 #90

How do logging and monitoring solutions contribute to data processing solutions? (Select all that apply)

- A. Provide insights into processing status
- B. Respond to processing failures promptly
- C. Ensure real-time data processing
- D. Automate data processing effectively

答案： A,B

解題說明：

Logging and monitoring solutions help respond to processing failures promptly and provide insights into processing status.

問題 #91

You're working with a large dataset containing website user activity, including 'session_id', 'user_id', 'timestamp', and 'page_view'. You suspect bot activity is skewing your engagement metrics. Bots tend to have very short session durations and high page view counts within those sessions. Which of the following Snowflake SQL queries, used in combination, would be MOST effective in identifying and flagging potential bot sessions, considering performance on a large dataset? Assume you have access to Snowflake's statistical functions.

- A. ☐
- B. ☒
- C. ☐
- D. ☐
- E. ☐

答案： B

解題說明：

Option E is most effective because it identifies bot sessions based on two distinct criteria: unusually high page view counts AND unusually short session durations, which are characteristic of bots. By combining these two conditions with standard deviations, it reduces the likelihood of false positives. All other answer choices only check rate and not the count or session duration.

問題 #92

In Snowflake, how does the implementation of primary keys for tables contribute to data integrity?

- A. Requires data redundancy
- B. Enforces uniqueness in table rows
- C. Only works on specific data types
- D. Limits data access for users

答案： B

解題說明：

Primary keys enforce uniqueness in table rows, ensuring data integrity by preventing duplicate entries within a table.

問題 #93

What critical role do user-defined functions (UDFs) play in data analysis using SQL?

- A. UDFs restrict data analysis to predefined operations.
- **B. They allow customization and extension of SQL functionalities for specific data operations.**
- C. UDFs are limited to specific data types.
- D. UDFs hinder query optimization in SQL.

答案：B

解題說明：

UDFs allow customization and extension of SQL functionalities beyond standard operations.
