Top Features of TorrentExam International Code Council Fire-Inspector-II Real Exam Questions

There may be customers who are concerned about the installation or use of our Fire-Inspector-II training questions. You don't have to worry about this. In addition to high quality and high efficiency, considerate service is also a big advantage of our company. We will provide 24 - hour online after-sales service to every customer. If you have any questions about installing or using our Fire-Inspector-II Real Exam, our professional after-sales service staff will provide you with warm remote service. As long as it is about our Fire-Inspector-II learning materials, we will be able to solve. Whether you're emailing or contacting us online, we'll help you solve the problem as quickly as possible. You don't need any worries at all.

International Code Council 67 - Fire Inspector II Exam Sample Questions (Q65-Q70):

NEW QUESTION # 65

Fire inspectors receiving citizen complaints about a building should first:

- A. investigate the history of the building.
- B. forward the complaint to the senior inspector.
- C. inform the owner of the building that a complaint has been filed against him.

- **D. record all pertinent information.**

Answer: D

Explanation:

Reference to Fire Inspection Procedures for Handling Complaints:

According to the International Fire Code (IFC 2021), Section 104.11, fire inspectors are responsible for investigating complaints regarding fire hazards or code violations.

The first step in responding to a citizen complaint is to record all pertinent information about the issue.

2. Steps in Handling a Fire Safety Complaint:

Step 1: Record detailed information about the complaint, including:

Complainant's name and contact information (if available).

Address and description of the building.

Nature of the alleged fire hazard or code violation.

Step 2: Verify the history of past violations (if necessary).

Step 3: Conduct an inspection to determine if a violation exists.

Step 4: Take appropriate enforcement action, if needed.

3. Clarification of Incorrect Answer Choices:

B: Investigate the history of the building # Incorrect

While past violations can provide context, the first step is to record the details of the current complaint before investigating further.

C: Forward the complaint to the senior inspector # Incorrect

Inspectors do not need to escalate every complaint immediately; instead, they should gather relevant information first.

D: Inform the owner of the building that a complaint has been filed against him # Incorrect Not all complaints result in violations, and notifying the owner prematurely may lead to unnecessary disputes or conflicts.

The inspector should first verify the validity of the complaint before notifying the owner.

4. Conclusion:

The correct and verified answer is A (record all pertinent information) as per IFC 104.11 and fire inspection best practices.

NEW QUESTION # 66

A building occupied for aerosol storage shall be classified as which of the following occupancy classifications?

- A. Group S-1
- B. High-hazard Group H-2
- **C. High-hazard Group H**
- D. High-hazard Group H-3

Answer: C

Explanation:

IFC Section 3804.1 classifies aerosol storage as Group H (high-hazard) if flammable, fitting option A.

Options B and C are subgroups (H-2, H-3), while D (Group S-1) is for moderate-hazard storage, not applicable. This is consistent with the study guide's occupancy classifications.

References: Fire Inspector II Study Guide, IFC Section 3804.1.

NEW QUESTION # 67

The maximum quantity of liquefied petroleum gas (LP-gas) in containers stored by a dealer awaiting resale, and are at one location in a building that is not open to the public, is ___ lb. water capacity.

- A. 2,500
- B. 0
- **C. 2,000**
- D. 1,000

Answer: C

Explanation:

LP-Gas Storage Limits for Dealers in Non-Public Buildings

According to the International Fire Code (IFC) 2021, Section 6109.9, the maximum allowable quantity of LP- gas in containers stored by a dealer awaiting resale in a building that is not open to the public is 2,000 pounds of water capacity.

This limit is intended to reduce fire and explosion hazards in enclosed spaces while allowing reasonable storage for commercial purposes.

2. Understanding Water Capacity vs. Propane Weight

The water capacity of an LP-gas cylinder refers to the total weight of water the container can hold, not the actual propane content. The propane content is typically about 42% of the water capacity (i.e., 2,000 lbs. of water capacity is approximately 840 lbs. of propane).

3. Verification of Other Options

Option A (735 lbs.) - Incorrect, as IFC allows a significantly higher storage limit for dealers in non-public buildings.

Option B (1,000 lbs.) - Incorrect, as the actual limit per IFC 6109.9 is 2,000 lbs.

Option D (2,500 lbs.) - Incorrect, as this exceeds the IFC's maximum allowable storage limit.

NEW QUESTION # 68

The maximum travel distance permitted in a one-story, Group F-2 building equipped with automatic sprinklers and automatic smoke and heat roof vents is ___ ft.

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

The maximum travel distance allowed in a one-story Group F-2 (Factory Industrial - Low Hazard) occupancy with automatic sprinklers and automatic smoke and heat vents is regulated by 2021 International Fire Code (IFC) Table 1017.2 - Exit Access Travel Distance.

IFC Table 1017.2 - Maximum Travel Distance:

For a Group F-2 occupancy equipped with an automatic sprinkler system, the maximum allowable exit access travel distance is 400 feet.

However, when automatic smoke and heat vents are installed, the travel distance is limited to 350 feet.

This is because while the sprinklers control fire spread, smoke and heat vents help with smoke control, allowing for extended egress distances but not as much as without them.

Why Other Options Are Incorrect?

A: 250 ft. - Too restrictive; the IFC allows a longer travel distance in this scenario.

B: 300 ft. - Less than the allowed 350 ft.

D: 400 ft. - Only applicable without smoke and heat vents.

NEW QUESTION # 69

For Halon 1211 hand-hose-line systems, all hoses for high-pressure systems must be tested at ___ psi

- A. 2,500
- B. 0
- C. 1
- D. 1,500

Answer: D

Explanation:

Reference to Halon 1211 Hand-Hose-Line System Requirements:

NFPA 12A (Standard on Halon 1211 Fire Extinguishing Systems), Section 6.5, states that all hoses for high-pressure Halon 1211 hand-hose-line systems must be tested at 1,500 psi to ensure they can withstand operational pressure without failure.

The International Fire Code (IFC 2021), Section 904.10, also references the requirements for Halon 1211 systems, ensuring proper testing for system integrity.

Purpose of Pressure Testing:

High-pressure Halon 1211 systems operate under significant force, and hose failures could result in loss of fire suppression capability or safety hazards.

Testing at 1,500 psi ensures hoses can handle peak pressures without rupture or degradation over time.

Clarification of Incorrect Answer Choices:

A: 600 psi # Incorrect

Too low for high-pressure systems, insufficient to verify hose integrity.

B: 900 psi # Incorrect

Below the required 1,500 psi standard for high-pressure Halon 1211 hoses.

D: 2,500 psi # Incorrect

Exceeds the required test pressure per NFPA 12A; unnecessary over-testing could damage hoses.

Conclusion:

The correct and verified answer is C (1,500 psi) based on NFPA 12A and IFC 904.10, ensuring compliance with Halon 1211 high-pressure system testing standards.

NEW QUESTION # 70

.....

Our users are all over the world, and our privacy protection system on the Fire-Inspector-II study guide is also the world leader. Our Fire-Inspector-II exam preparation will protect the interests of every user. Now that the network is so developed, we can disclose our information at any time. You must recognize the seriousness of leaking privacy. For security, you really need to choose an authoritative product like our Fire-Inspector-II learning braindumps.
