If you study with our 1z0-076 exam questions, then you will be surprised to find that our 1z0-076 training material is well-written and excellently-organised. That is because our experts fully considered the differences in learning methods and 1z0-076 examination models between different majors and eventually formed a complete review system. It will help you to Pass 1z0-076 Exam successfully after a series of exercises, correction of errors, and self-improvement. Our 1z0-076 exam questions contain everything you need to pass the exam.

### Oracle Database 19c: Data Guard Administration Sample Questions (Q33-Q38):

#### NEW QUESTION # 33

You are planning to perform block comparison using the dbms comp package:

Which TWO statements are true?

- A. It requires that the DB\_LOST\_WRITE\_protect initialization parameter be enabled.
- B. The databases should be at least mounted before block comparison.**
- C. You can monitor the progress of an ongoing block comparison operation by querying VS SESSION\_LONGOPS.**
- D. It can be used to detect lost writes and inconsistencies between the primary database and the cascaded standbys.
- E. Logical standby databases can be the target database for the dbms\_dbcomp.dbcomp procedure.

**Answer: B,C**

Explanation:

The DBMS\_COMPARISON package, used for comparing and converging data objects within a single database or between databases, requires that the databases involved in the block comparison be at least mounted (A). This allows the procedure to access the data blocks for comparison. Additionally, the progress of long-running operations such as block comparison can be monitored using the dynamic performance view V\$SESSION\_LONGOPS (D), which provides information on the operation's progress and estimated completion time.

References:Oracle Database PL/SQL Packages and Types Reference provides comprehensive details on the DBMS\_COMPARISON package, including its procedures and how to monitor their progress. Additionally, Oracle Database Reference explains the V\$SESSION\_LONGOPS view, which is commonly used for monitoring long operations in the database.

#### NEW QUESTION # 34

Your Data Guard environment has a remote physical standby database with real-time query enabled, which is used for reporting, and a logical standby database used for DSS reporting.

Switchovers or failovers are possible due to testing or in case of a disaster.

Clients use local TNSNAMES.ORA files to define connection strings to the database instances.

Which three will prevent clients from connecting to the wrong database instances?

- A. The standby database services must be defined statically with the Listeners running on the standby database hosts.**
- B. The DB\_NAME and DB\_UNIQUE\_NAME parameters must be set to the same value for all the databases in the Data Guard environment.
- C. Oracle Net connectivity to the primary database instance must be established on all the standby database instances.
- D. The client applications must use the correct TNS entries when requesting connections to the database instances.**
- E. The LOCAL\_LISTENER parameter on the primary database instance must always be set.
- F. A service name is registered with the local listener of each database instance.
- G. Client TNS entries for the databases use the correct service names for the intended service.**

**Answer: A,D,G**

Explanation:

Based on Oracle Database 19c: Data Guard Administration documents, the three measures that can prevent clients from connecting to the wrong database instances during switchovers, failovers, or regular operations in a Data Guard environment are:

- B. The standby database services must be defined statically with the Listeners running on the standby database hosts.
- D. The client applications must use the correct TNS entries when requesting connections to the database instances.

E. Client TNS entries for the databases use the correct service names for the intended service.

In an Oracle Data Guard configuration, correctly configuring Oracle Net Services (including TNS entries and listeners) is crucial for ensuring that clients connect to the appropriate database instance, whether it's the primary or standby. Defining services on the standby database and associating them with listeners ensures that client applications can connect to the standby when needed, especially useful in a role transition or when the standby is open for read-only access or real-time query. It's essential that TNS entries used by client applications specify the correct service names that correspond to the intended database roles, such as primary or standby. This setup facilitates seamless connectivity to the appropriate instance based on the role, especially critical during switchovers and failovers when the roles of the databases change.

Reference:

Oracle's Data Guard concepts and administration guide provides extensive information on configuring network services for Data Guard environments, ensuring that applications connect to the correct database instance based on the current role of the databases in the Data Guard configuration.

### NEW QUESTION # 35

Which THREE statements are true about snapshot standby databases?

- A. FLASHBACK DATABASE is enabled automatically on a physical standby database as part of the conversion into a snapshot standby database, if not already enabled.
- B. A snapshot standby database may be opened read-write.
- C. A snapshot standby database may be opened read-only.
- D. A snapshot standby database can have Real-Time apply enabled.
- E. FLASHBACK DATABASE must be manually enabled on a physical standby database before converting it into a snapshot standby database.
- F. FLASHBACK DATABASE is enabled automatically on a snapshot standby database after converting it from a physical standby database if not already enabled.

**Answer: A,B,F**

Explanation:

Snapshot standby databases are a feature of Oracle Data Guard that allows a physical standby database to be temporarily converted into a read-write database for testing or other purposes. The true statements about snapshot standby databases are:

\* FLASHBACK DATABASE is enabled automatically on a snapshot standby database after converting it from a physical standby database if not already enabled (B): When a physical standby is converted to a snapshot standby, FLASHBACK DATABASE is automatically enabled to allow the database to be easily reverted back to its original state.

\* FLASHBACK DATABASE is enabled automatically on a physical standby database as part of the conversion into a snapshot standby database, if not already enabled (C): As part of the conversion process, FLASHBACK DATABASE is turned on to ensure that changes made while the database is in snapshot standby mode can be undone.

\* A snapshot standby database may be opened read-write (E): Once a physical standby is converted to a snapshot standby, it can be opened for read-write operations, allowing for testing and other tasks that require a writable database.

### NEW QUESTION # 36

Which four statements are true regarding SQL Apply filters for a logical standby database?

- A. They can only be used to skip DML statements on a table.
- B. They can be used to skip ALTER TABLE commands on specific tables.
- C. They can be used to skip ALTER SEQUENCE and ALTER DATABASE commands.
- D. They can be used to skip CREATE TABLE commands.
- E. They can be used to skip all SQL statements executed on a specific pluggable database (PDB) within a standby multitenant container database (CDB).
- F. They can be used to stop SQL apply if it encounters an error.
- G. They can be used to skip execution of DML triggers on a table while allowing the DML to execute.

**Answer: B,C,D,G**

Explanation:

Based on the Oracle Database 19c documentation, the correct answers about SQL Apply filters for a logical standby database

are:A. They can be used to skip execution of DML triggers on a table while allowing the DML to execute.B. They can be used to skip CREATE TABLE commands.C. They can be used to skip ALTER SYSTEM and ALTER DATABASE commands.G. They can be used to skip ALTER TABLE commands on specific tables.

Comprehensive Detailed Explanation:SQL Apply filters in a logical standby database can be set to control which SQL operations are applied to the standby. These filters allow for certain commands to be skipped, ensuring that they do not impact the standby database. For example, filters can be used to skip the execution of DML triggers to prevent them from firing during SQL Apply, while still allowing the underlying DML to be executed on the logical standby database. This is particularly useful when certain triggers are not desired to run in a standby environment. CREATE TABLE, ALTER SYSTEM, ALTER DATABASE, and specific ALTER TABLE commands can also be skipped using SQL Apply filters to prevent unwanted structural changes or administrative operations from affecting the logical standby database. These capabilities provide a level of control to ensure that the logical standby database reflects only the desired state of the primary database.

References:Oracle Database SQL Language Reference and Oracle Data Guard Concepts and Administration guide offer comprehensive details on the use of SQL Apply filters, including the range of SQL statements that can be influenced by these filters in a logical standby database environment.

### NEW QUESTION # 37

Which THREE statements are true about snapshot standby databases?

- A. If datafiles grow while a database is a snapshot standby database, then they shrink when converted back to a physical standby database.
- B. A snapshot standby database can be the only standby database in a Maximum Protection Oracle Data Guard configuration.
- C. A snapshot standby database must be opened at least once in read-write mode before it can be converted into a physical standby database.
- D. Snapshot standby databases may be used for rolling database upgrades.
- E. A guaranteed restore point is created automatically when a physical standby database is converted into a snapshot standby database.

Answer: C,D,E

### NEW QUESTION # 38
