bestehen Sie GH-500 Ihre Prüfung mit unserem Prep GH-500 Ausbildung Material & kostenloser Dowload Torrent

Übrigens, Sie können die vollständige Version der EchteFrage GH-500 Prüfungsfragen aus dem Cloud-Speicher herunterladen: https://drive.google.com/open?id=1EwX2a4yJuMGN_6_A0WHa1qoJPwVSJUhv

Wofür zögern Sie noch? Sie haben nur eine Chance. Jetzt können Sie die vollständige Version zur Microsoft GH-500 Zertifizierungsprüfung bekommen. Sobald Sie die EchteFrage klicken, wird Ihr kleiner Traum verwirklicht werden. Sie haben die besten Schulungsunterlagen zur Microsoft GH-500 Zertifizierungsprüfung gekriegen. Benutzen Sie beruhigt unsere Microsoft GH-500 Prüfungsfragen und Antworten, werden Sie sicher die Microsoft GH-500 Prüfung bestehen.

Wenn Sie die Schulungsunterlagen zur Microsoft GH-500 Zertifizierungsprüfung haben, dann werden Sie sicherlich erfolgreich sein. Nachdem Sie unsere Lehrbücher gekauft haben,werden Sie einjährige Aktualisierung kostenlos genießen. Die Bestehensrate von Microsoft GH-500 ist 100%. Wenn Sie die Zertifizierungsprüfung nicht bestehen oder die Schulungsunterlagen zur Microsoft GH-500 Zertifizierungsprüfung irgend ein Problem haben, geben wir Ihnen eine bedingungslose volle Rückerstattung.

GH-500 Zertifizierungsfragen, Microsoft GH-500 PrüfungFragen

Unser EchteFrage ist eine fachliche IT-Website. Ihre Erfolgsquote beträgt 100%. Viele Kandidaten haben das schon bewiesen. Weil wir ein riesiges IT-Expertenteam hat, das nach ihren fachlichen Erfahrungen und Kenntnissen die Microsoft GH-500

Prüfungsfragen und Antworten bearbeitet, um die Interessen der Kandidaten zu schützen und zugleich ihren Bedürfnisse abzudecken. Nach den Bedürfnissen der Kandidaten haben sie zielgerichtete und anwendbare Schulungsmaterialien entworfen, nämlich die Schulungsunterlagen zur Microsoft GH-500 Zertifizierungsprüfung, die Fragen und Antworten enthalten.

Microsoft GH-500 Prüfungsplan:

Thema	Einzelheiten
Thema 1	• Describe GitHub Advanced Security best practices, results, and how to take corrective measures: This section evaluates skills of Security Managers and Development Team Leads in effectively handling GHAS results and applying best practices. It includes using Common Vulnerabilities and Exposures (CVE) and Common Weakness Enumeration (CWE) identifiers to describe alerts and suggest remediation, decision-making processes for closing or dismissing alerts including documentation and data-based decisions, understanding default CodeQL query suites, how CodeQL analyzes compiled versus interpreted languages, the roles and responsibilities of development and security teams in workflows, adjusting severity thresholds for code scanning pull request status checks, prioritizing secret scanning remediation with filters, enforcing CodeQL and Dependency Review workflows via repository rulesets, and configuring code scanning, secret scanning, and dependency analysis to detect and remediate vulnerabilities earlier in the development lifecycle, such as during pull requests or by enabling push protection.
Thema 2	• Describe the GHAS security features and functionality: This section of the exam measures skills of Security Engineers and Software Developers and covers understanding the role of GitHub Advanced Security (GHAS) features within the overall security ecosystem. Candidates learn to differentiate security features available automatically for open source projects versus those unlocked when GHAS is paired with GitHub Enterprise Cloud (GHEC) or GitHub Enterprise Server (GHES). The domain includes knowledge of Security Overview dashboards, the distinctions between secret scanning and code scanning, and how secret scanning, code scanning, and Dependabot work together to secure the software development lifecycle. It also covers scenarios contrasting isolated security reviews with integrated security throughout the development lifecycle, how vulnerable dependencies are detected using manifests and vulnerability databases, appropriate responses to alerts, the risks of ignoring alerts, developer responsibilities for alerts, access management for viewing alerts, and the placement of Dependabot alerts in the development process.
Thema 3	• Configure and use Dependabot and Dependency Review: Focused on Software Engineers and Vulnerability Management Specialists, this section describes tools for managing vulnerabilities in dependencies. Candidates learn about the dependency graph and how it is generated, the concept and format of the Software Bill of Materials (SBOM), definitions of dependency vulnerabilities, Dependabot alerts and security updates, and Dependency Review functionality. It covers how alerts are generated based on the dependency graph and GitHub Advisory Database, differences between Dependabot and Dependency Review, enabling and configuring these tools in private repositories and organizations, default alert settings, required permissions, creating Dependabot configuration files and rules to auto-dismiss alerts, setting up Dependency Review workflows including license checks and severity thresholds, configuring notifications, identifying vulnerabilities from alerts and pull requests, enabling security updates, and taking remediation actions including testing and merging pull requests.
Thema 4	• Configure and use secret scanning: This domain targets DevOps Engineers and Security Analysts with the skills to configure and manage secret scanning. It includes understanding what secret scanning is and its push protection capability to prevent secret leaks. Candidates differentiate secret scanning availability in public versus private repositories, enable scanning in private repos, and learn how to respond appropriately to alerts. The domain covers alert generation criteria for secrets, user role-based alert visibility and notification, customizing default scanning behavior, assigning alert recipients beyond admins, excluding files from scans, and enabling custom secret scanning within repositories.

Thema 5	• Configure and use Code Scanning with CodeQL: This domain measures skills of Application Security Analysts and DevSecOps Engineers in code scanning using both CodeQL and third-party tools. It covers enabling code scanning, the role of code scanning in the development lifecycle, differences between enabling CodeQL versus third-party analysis, implementing CodeQL in GitHub Actions workflows versus other CI tools, uploading SARIF results, configuring workflow frequency and triggering events, editing workflow templates for active repositories, viewing CodeQL scan results, troubleshooting workflow failures and customizing configurations, analyzing data flows through code, interpreting code scanning alerts with linked documentation, deciding when to dismiss alerts, understanding CodeQL limitations related to compilation and language support, and defining SARIF categories.

Microsoft GitHub Advanced Security GH-500 Prüfungsfragen mit Lösungen (Q18-Q23):

18. Frage
Who can fix a code scanning alert on a private repository?

- A. Users who have Write access to the repository
- B. Users who have the Triage role within the repository
- C. Users who have the security manager role within the repository
- D. Users who have Read permissions within the repository

Antwort: A

Begründung:
Comprehensive and Detailed Explanation:
In private repositories, users with write access can fix code scanning alerts. They can do this by committing changes that address the issues identified by the code scanning tools. This level of access ensures that only trusted contributors can modify the code to resolve potential security vulnerabilities.
GitHub Docs
Users with read or triage roles do not have the necessary permissions to make code changes, and the security manager role is primarily focused on managing security settings rather than directly modifying code.
Reference:
GitHub Docs

19. Frage
When configuring code scanning with CodeQL, what are your options for specifying additional queries? (Each answer presents part of the solution. Choose two.)

- A. Scope
- B. Queries
- C. Packs
- D. github/codeql

Antwort: B,C

Begründung:
You can customize CodeQL scanning by including additional query packs or by specifying individual queries:
Packs: These are reusable collections of CodeQL queries bundled into a single package.
Queries: You can point to specific files or directories containing .ql queries to include in the analysis.
github/codeql refers to a pack by name but is not a method or field. Scope is not a valid field used for configuration in this context.

20. Frage
Which of the following workflow events would trigger a dependency review? (Each answer presents a complete solution. Choose two.)

- A. commit

- B. workflow_dispatch
- C. pull_request
- D. trigger

Antwort: B,C

Begründung:
Comprehensive and Detailed Explanation:
Dependency review is triggered by specific events in GitHub workflows:
pull_request: When a pull request is opened, synchronized, or reopened, GitHub can analyze the changes in dependencies and provide a dependency review.
workflow_dispatch: This manual trigger allows users to initiate workflows, including those that perform dependency reviews.
The trigger and commit options are not recognized GitHub Actions events and would not initiate a dependency review.

21. Frage
Which of the following features helps to prioritize secret scanning alerts that present an immediate risk?

- A. Secret validation
- B. Custom pattern dry runs
- C. Non-provider patterns
- D. Push protection

Antwort: A

Begründung:
Secret validation checks whether a secret found in your repository is still valid and active with the issuing provider (e.g., AWS, GitHub, Stripe). If a secret is confirmed to be active, the alert is marked as verified, which means it's considered a high-priority issue because it presents an immediate security risk.
This helps teams respond faster to valid, exploitable secrets rather than wasting time on expired or fake tokens.

22. Frage
Which Dependabot configuration fields are required? (Each answer presents part of the solution. Choose three.)

- A. directory
- B. package-ecosystem
- C. milestone
- D. schedule.interval
- E. allow

Antwort: A,B,D

Begründung:
Comprehensive and Detailed Explanation:
When configuring Dependabot via the dependabot.yml file, the following fields are mandatory for each update configuration:
directory: Specifies the location of the package manifest within the repository. This tells Dependabot where to look for dependency files.
package-ecosystem: Indicates the type of package manager (e.g., npm, pip, maven) used in the specified directory.
schedule.interval: Defines how frequently Dependabot checks for updates (e.g., daily, weekly). This ensures regular scanning for outdated or vulnerable dependencies.
The milestone field is optional and used for associating pull requests with milestones. The allow field is also optional and used to specify which dependencies to update.
GitLab
