

Questions Mule-Dev-301 Pdf & Mule-Dev-301 Latest Exam Camp

DATA EXPLORATION AND VISUALIZATION

UNIT:1

1. Explain the Purpose of EDA
2. Differentiate EDA from Classical Analysis
3. Illustrate Software tools and Visual Aids in EDA
4. Describe Data Transformation in EDA
5. Explore the Significance of Grouping Datasets and how it aids in focused analysis.
6. Explain the Role of Data Aggregation
7. Illustrate the Application of Pivot Tables
8. Compare EDA with Bayesian Analysis

UNIT:2

1. Explain the Process of Creating a Simple Line Plot in Matplotlib?
2. Illustrate the Use of Scatter Plots in Visualizing Relationships?
3. Describe the Role of Density Plots in Data Visualization?
4. Illustrate the Construction and Interpretation of Histograms?
5. Describe the role of legends in plots and provide examples to illustrate how they contribute to making plots more informative and interpretable?
6. Describe the Customization Options in Matplotlib?
7. Provide a step-by-step illustration of how to create subplots in Matplotlib?
8. Explain the purpose of using subplots and their significance in complex visualizations?
9. Explain the Process of Geographic Data Visualization with Basemap?

UNIT:3

1. Explain the Significance of Numerical Summaries in Single Variable Analysis?
2. Illustrate the Process of Scaling and Standardizing Variables?
3. Describe the Role of Interquartile Range (IQR) in Data Analysis?
4. Explain the Concept of Skewness and Its Impact on Distributions?
5. Illustrate the Application of Kernel Density Estimation in Data Visualization?
6. Describe the Importance of Outlier Detection in Data Analysis?
7. Explain the Purpose of Time Series Smoothing Techniques?
8. Provide a step-by-step illustration of calculating the Coefficient of Variation (CV)?

Salesforce Certified MuleSoft Developer II Sample Questions (Q14-Q19):

NEW QUESTION # 14

A Mule application for processing orders must log the order ID for every log message output. What is a best practice to enrich every log message with the order ID?

- A. Set a flow variable and edit the log4/2.xml file to output the variable as part of the message pattern
- **B. Use the Tracing module to set logging variables with a Mapped Diagnostic Context**
- C. Use flow variables within every logger processor to log the order ID
- D. Create a custom XML SDK component to wrap the logger processor and automatically add the order ID within the connector

Answer: B

Explanation:

To enrich every log message with the order ID, the developer should use the Tracing module to set logging variables with a Mapped Diagnostic Context (MDC). The Tracing module allows adding custom key-value pairs to log messages using MDC variables. The developer can use Set Logging Variables operation to set the order ID as an MDC variable and then use it in any logger processor within the same thread or event. Reference: <https://docs.mulesoft.com/tracing-module/1.0/tracing-module-reference#set-logging-variables>

NEW QUESTION # 15

Which pattern should be used to invoke multiple HTTP APIs in parallel and roll back failed requests in sequence?

- A. A database as a transactional outbox and an Until Successful router to retry any requests
- **B. Scatter-Gather as central Saga orchestrator for all API request with compensating actions for failing routes**
- C. VM queues as a reliability pattern with error handlers to roll back any requests
- D. A Parallel for Each scope with each HTTP request wrapped in a Try scope

Answer: B

Explanation:

To invoke multiple HTTP APIs in parallel and roll back failed requests in sequence, the developer should use a Scatter-Gather router as a central Saga orchestrator for all API requests with compensating actions for failing routes. A Scatter-Gather router executes multiple routes concurrently and aggregates the results. A Saga orchestrator coordinates a series of actions across different services and handles failures by executing compensating actions. Therefore, using a Scatter-Gather router as a Saga orchestrator allows invoking multiple HTTP APIs in parallel and rolling back any failed requests in sequence. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/scatter-gather-concept> <https://docs.mulesoft.com/mule-runtime/4.3/saga>

NEW QUESTION # 16

In a Mule project, Flow-1 contains a flow-ref to Flow-2 depends on data from Flow-1 to execute successfully. Which action ensures the test suites and test cases written for Flow-1 and Flow-2 will execute successfully?

- A. Use 'After Test Case' to produce the data needed from Flow-1 test cases to pass to Flow-2 test cases
- **B. Use "Set Event to pass the input that is needed, and keep the test cases for Flow-1 and Flow-2 independent"**
- C. Use "Before Test Case" To collect data from Flow-1 test cases before running Flow-2 test cases
- D. Chain together the test suites and test cases for Flow-1 and Flow-2

Answer: B

Explanation:

To ensure the test suites and test cases written for Flow-1 and Flow-2 will execute successfully, the developer should use a Set Event processor to pass the input that is needed by Flow-2, and keep the test cases for Flow-1 and Flow-2 independent. This way, the developer can isolate the testing of each flow and avoid coupling them together. Reference: <https://docs.mulesoft.com/munit/2.3/munit-test-flow>

NEW QUESTION # 17

A developer has created the first version of an API designed for business partners to work commodity prices. What should developer do to allow more than one major version of the same API to be exposed by the implementation?

- A. In Design Center, open the RAML and modify baseUri to include a variable that indicates the version number
- B. In Anypoint Studio, generate scaffolding from the RAML, and then modify the <http:listener> in the generated flows to include a parameter to replace the version number
- C. In Anypoint Studio, generate scaffolding from the RAML, and then modify the flow names generated by APIKit to include a variable with the major version number
- D. In Design Center, open the RAML and modify each operation to include the major version number

Answer: A

Explanation:

To allow more than one major version of the same API to be exposed by the implementation, the developer should modify the baseUri property in the RAML file to include a variable that indicates the version number. The baseUri property defines the base URL of the API and can include variables that are replaced with actual values when mocking or deploying the API. By using a variable for the version number, the developer can expose different versions of the API using different base URLs and avoid conflicts or confusion. Reference: <https://docs.mulesoft.com/api-designer/design-modify-raml-specs#baseuri>
<https://docs.mulesoft.com/api-manager/2.x/api-versioning>

NEW QUESTION # 18

Refer to the exhibits.

Bioinfo System API is implemented and published to Anypoint Exchange. A developer wants to invoke this API using its REST Connector.

What should be added to the POM?

- A.

```
<dependency>
  <groupId>XXXXX-XXXXXXX-XXXX-XXXX-XXXX-X</groupId>
  <artifactId>mule-plugin-bio-info</artifactId>
  <version>1.0.0</version>
  <classifier>mule-plugin</classifier>
</dependency>
```

```
<plugin>
  <groupId>XXXXX-XXXXXXX-XXXX-XXXX-XXXX-X</groupId>
  <artifactId>mule-plugin-bio-info</artifactId>
  <version>1.0.0</version>
  <classifier>mule-plugin</classifier>
</plugin>
```

- B.
- C.

```
<dependency>
  <groupId>XXXXX-XXXXXXX-XXXX-XXXX-XXXX-X</groupId>
  <artifactId>mule-plugin-bio-info</artifactId>
  <version>1.0.0</version>
  <classifier>mule-plugin</classifier>
  <artifactId>mule-plugin-bio-info</artifactId>
  <version>1.0.0</version>
  <classifier>mule-plugin</classifier>
</res>
```

- D.

```
<rest-connect>
  <groupId>XXXXX-XXXXXXX-XXXX-XXXX-XXXX-X</groupId>
  <artifactId>mule-plugin-bio-info</artifactId>
  <version>1.0.0</version>
  <classifier>mule-plugin</classifier>
</rest-connect>
```

```
<repository>
  <groupId>XXXXX-XXXXXXX-XXXX-XXXX-XXXX-X</groupId>
  <artifactId>mule-plugin-bio-info</artifactId>
  <version>1.0.0</version>
  <classifier>mule-plugin</classifier>
</repository>
```

- E.

Answer: B

Explanation:

To invoke Bioinfo System API using its REST Connector, option E should be added to the pom.xml file. This option adds a dependency for Bioinfo System API REST Connector with its group ID, artifact ID, version, classifier, and type. The classifier specifies that it is a REST Connector (raml-client), and the type specifies that it is a Mule plugin (mule-plugin). Reference: <https://docs.mulesoft.com/apikit/4.x/apikit-4-generate-from-rest-api-task#add-the-api-dependency-to-the-pom-file>
