

# ISC - CISSP - Updated Certified Information Systems Security Professional (CISSP) Pdf Exam Dump

P.S. Free & New CISSP dumps are available on Google Drive shared by TestPDF: <https://drive.google.com/open?id=19Qwcl1gkMr5ABTG4nn5IP5U9AwnLwUwD>

We find methods to be success, and never find excuse to be failure. In order to provide the most authoritative and effective CISSP exam software, the IT elite of our TestPDF study CISSP exam questions carefully and collect the most reasonable answer analysis. The CISSP Exam Certification is an important evidence of your IT skills, which plays an important role in your IT career.

The CISSP Exam consists of 250 multiple-choice questions, and the exam duration is six hours. CISSP exam tests the candidate's knowledge in eight domains of information security, which include security and risk management, asset security, security architecture and engineering, communication and network security, identity and access management, security assessment and testing, security operations, and software development security.

## 2026 CISSP Pdf Exam Dump Pass Certify | Efficient Exam CISSP Study Solutions: Certified Information Systems Security Professional (CISSP)

For candidates who are going to buying CISSP training materials online, you may pay more attention to the privacy protection. We respect the private information of you. If you choose us, we can ensure you that your personal information such as your name and

email address will be protected well. Once the order finishes, your personal information will be concealed. Besides, CISSP Exam Materials contain both questions and answers, and it's convenient for you to have a check of answers. We have online and offline chat service for CISSP exam materials, if you have any questions, you can have a conversation with them.

Preparing for the CISSP Exam requires dedication and hard work. Candidates must have a deep understanding of the ten domains covered in the exam and must be able to apply this knowledge to real-world scenarios. There are numerous study resources available to help candidates prepare for the exam, including study guides, practice exams, and online courses. Candidates are also encouraged to join study groups and attend training sessions to enhance their knowledge and skills.

## ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q764-Q769):

### NEW QUESTION # 764

An organization is implementing data encryption using symmetric ciphers and the Chief Information Officer (CIO) is concerned about the risk of using one key to protect all sensitive data. The security practitioner has been tasked with recommending a solution to address the CIO's concerns. Which of the following is the BEST approach to achieving the objective by encrypting all sensitive data?

- A. Use Rivest-Shamir-Adleman (RSA) keys.
- B. Use a Secure Hash Algorithm 256 (SHA-256).
- C. Use Hash Message Authentication Code (HMAC) keys.
- **D. Use a hierarchy of encryption keys.**

**Answer: D**

Explanation:

One good way is by using a key hierarchy. This is simply a way to organize encryption keys so that a root (or master) key is used to encrypt other keys that are in turn used to encrypt the actual data you want to protect. A key hierarchy provides a powerful pattern for storing an application's cryptographic keys. It also allows you to use different keys for different data while allowing you to focus your protection efforts on the master key.

### NEW QUESTION # 765

A security compliance manager of a large enterprise wants to reduce the time it takes to perform network, system, and application security compliance audits while increasing quality and effectiveness of the results. What should be implemented to BEST achieve the desired results?

- A. System performance monitoring application
- **B. Configuration Management Database (CMDB)**
- C. Configuration Management Plan (CMP)
- D. Source code repository

**Answer: B**

Explanation:

A Configuration Management Database (CMDB) is a database that stores information about configuration items (CIs) for use in change, release, incident, service request, problem, and configuration management processes. A CI is any component or resource that is part of a system or a network, such as hardware, software, documentation, or personnel. A CMDB can provide some benefits for security compliance audits, such as:

\* Reducing the time it takes to perform network, system, and application security compliance audits, by providing a centralized and updated source of information about the CIs, their attributes, their relationships, and their dependencies, which can help to identify and locate the CIs that are subject to the audit, and to avoid duplication or omission of the audit tasks.

\* Increasing the quality and effectiveness of the results of network, system, and application security compliance audits, by providing a consistent and accurate view of the current and historical state of the CIs, their compliance status, and their changes, which can help to verify and validate the compliance of the CIs with the policies and standards, and to detect and report any deviations or violations.

A source code repository, a configuration management plan (CMP), and a system performance monitoring application are not the best options to achieve the desired results of reducing the time and increasing the quality and effectiveness of network, system, and application security compliance audits, although they may be related or useful tools or techniques. A source code repository is a database or a system that stores and manages the source code of a software or an application, and that supports version control, collaboration, and documentation of the code. A source code repository can provide some benefits for security compliance audits,

such as:

\* Reducing the time it takes to perform application security compliance audits, by providing a centralized and accessible source of information about the code, its versions, its changes, and its history, which can help to identify and locate the code that is subject to the audit, and to avoid duplication or omission of the audit tasks.

\* Increasing the quality and effectiveness of the results of application security compliance audits, by providing a consistent and accurate view of the current and historical state of the code, its compliance status, and its changes, which can help to verify and validate the compliance of the code with the policies and standards, and to detect and report any deviations or violations.

However, a source code repository is not the best option to achieve the desired results of reducing the time and increasing the quality and effectiveness of network, system, and application security compliance audits, as it is only applicable to the application layer, and it does not provide information about the other CIs that are part of the system or the network, such as hardware, documentation, or personnel. A configuration management plan (CMP) is a document or a policy that defines and describes the objectives, scope, roles, responsibilities, processes, and procedures of configuration management, which is the process of identifying, controlling, tracking, and auditing the changes to the CIs. A CMP can provide some benefits for security compliance audits, such as:

\* Reducing the time it takes to perform network, system, and application security compliance audits, by providing a clear and comprehensive guidance and direction for the configuration management activities, which can help to ensure the consistency and the efficiency of the configuration management process, and to avoid confusion or conflicts among the configuration management stakeholders.

\* Increasing the quality and effectiveness of the results of network, system, and application security compliance audits, by providing a framework and a standard for the configuration management activities, which can help to ensure the alignment and the compliance of the configuration management process with the policies and standards, and to support the audit and the compliance activities.

However, a CMP is not the best option to achieve the desired results of reducing the time and increasing the quality and effectiveness of network, system, and application security compliance audits, as it is not a database or a system that stores and provides information about the CIs, but rather a document or a policy that defines and describes the configuration management process. A system performance monitoring application is a software or a tool that collects and analyzes data and metrics about the performance and the behavior of a system or a network, such as availability, reliability, throughput, response time, or resource utilization. A system performance monitoring application can provide some benefits for security compliance audits, such as:

\* Reducing the time it takes to perform network and system security compliance audits, by providing a real-time and automated source of information about the performance and the behavior of the system or the network, which can help to identify and locate the issues or the problems that may affect the compliance of the system or the network, and to avoid manual or tedious audit tasks.

\* Increasing the quality and effectiveness of the results of network and system security compliance audits, by providing a quantitative and objective view of the performance and the behavior of the system or the network, which can help to measure and evaluate the compliance of the system or the network with the policies and standards, and to detect and report any anomalies or deviations.

However, a system performance monitoring application is not the best option to achieve the desired results of reducing the time and increasing the quality and effectiveness of network, system, and application security compliance audits, as it is only applicable to the network and system layers, and it does not provide information about the other CIs that are part of the system or the network, such as software, documentation, or personnel.

#### NEW QUESTION # 766

Which of the following is NOT a property of a one-way hash function?

- A. It is computationally infeasible to construct two different messages with the same digest
- B. It converts a message of arbitrary length into a message digest of a fixed length
- C. Given a digest value, it is computationally infeasible to find the corresponding message
- **D. It converts a message of a fixed length into a message digest of arbitrary length**

**Answer: D**

#### NEW QUESTION # 767

Which of the following computer design approaches is based on the fact that in earlier technologies, the instruction fetch was the longest part of the cycle?

- A. Scalar processors
- B. Reduced Instruction Set Computers (RISC)
- C. Pipelining
- **D. Complex Instruction Set Computers (CISC)**

**Answer: D**

Explanation:

Reference: pg 255 Krutz: CISSP Prep Guide: Gold Edition

### NEW QUESTION # 768

Data which is properly secured and can be described with terms like genuine or not corrupted from the original refers to data that has a high level of what?

- A. Non-Repudiation
- **B. Authenticity**
- C. Authorization
- D. Availability

**Answer: B**

Explanation:

Authenticity refers to the characteristic of a communication, document or any data that ensures the quality of being genuine or not corrupted from the original.

The following answers are incorrect: Authorization is wrong because this refers to a users ability to access data based upon a set of credentials. Availability is wrong because this refers to systems which deliver data are accessible when and where required by users. Non-Repudiation is wrong because this is where a user cannot deny their actions on data they processed. Classic example is a legal document you signed either manually with a pen or digitally with a signing certificate. If it is signed then you cannot proclaim you did not send the document or do a transaction.

The following reference(s) were/was used to create this question: 2011 EC-COUNCIL Official Curriculum, Ethical Hacking and Countermeasures, Volume 1, Module 1, Page. 11
