In this website, you can find three different versions of our 212-89 guide torrent which are prepared in order to cater to the different tastes of different people from different countries in the world since we are selling our 212-89 test torrent in the international market. Most notably, the simulation test is available in our software version. With the simulation test, all of our customers will have an access to get accustomed to the 212-89 Exam atmosphere and pass easily in the real 212-89 exam.

EC-COUNCIL 212-89 certification is highly regarded in the information security industry and is recognized by major organizations worldwide. It is a vendor-neutral certification, which means that it is not tied to any specific technology or product. This makes it a valuable and versatile credential that can be applied in various industries and organizations. EC Council Certified Incident Handler (ECIH v3) certification demonstrates the candidate's proficiency in incident handling and response, which is a critical skill in today's cyber threat landscape.

EC-Council Certified Incident Handler (ECIH) is a certification program designed to equip individuals with the necessary skills to handle and respond to various types of security incidents. The ECIH program is globally recognized and accredited by the American National Standards Institute (ANSI). The program covers a broad range of topics, including incident handling process, types of incidents, and incident reporting, among others. 212-89 course is ideal for IT and security professionals who want to enhance their skills in handling and responding to security incidents.

EC-COUNCIL EC Council Certified Incident Handler (ECIH v3) Sample Questions (Q282-Q287):

NEW QUESTION # 282

Which of the following risk mitigation strategies involves the execution of controls to reduce the risk factor and bring it to an acceptable level, or accepts the potential risk and continues operating the IT system?

- A. Risk assumption
- B. Risk avoidance
- C. Risk transference
- D. Risk planning

Answer: A

NEW QUESTION # 283

A ransomware attack recently disrupted operations at a manufacturing facility, specifically targeting its IoT- integrated conveyor system. While attempting to recover from the incident, the incident response team discovered that the available backups were incomplete-several critical sensor logs and control commands were missing, which caused delays in restoring device functions and syncing with other systems. The team concludes that relying on traditional backup routines alone is insufficient for restoring full IoT functionality after an attack. Which strategy would best prevent such issues in future recovery efforts?

- A. Maintain synchronized cloud replicas of critical IoT resources.
- B. Schedule periodic external hard drive backups for operator terminals.
- C. Store historical sensor logs in compressed ZIP archives on shared drives.
- D. Use long-term tape archival for all IoT firmware images.

Answer: A

Explanation:

This scenario highlights recovery challenges specific to IoT environments, which are addressed in the ECIH Endpoint and IoT Incident Handling modules. IoT systems generate continuous streams of operational data, configuration states, and control commands that are essential for accurate recovery after disruption.

Option D is correct because maintaining synchronized cloud replicas of critical IoT resources ensures near- real-time availability of sensor data, device configurations, and control logic. ECIH emphasizes that traditional periodic backups are often insufficient for IoT and OT systems due to their dynamic and state- dependent nature. Cloud replication supports faster, more complete restoration and reduces data gaps.

Options A, B, and C rely on static or delayed backup mechanisms that cannot capture the operational state required to restore IoT systems accurately. Tape archives and external drives introduce latency and risk data loss, while ZIP archives lack synchronization. ECIH recovery guidance stresses resilience and continuity, particularly for operational technology.

Continuous replication is therefore the most effective strategy.

NEW QUESTION # 284

Rinni is an incident handler and she is performing memory dump analysis.

Which of following tools she can use in order to perform memory dump analysis?

- A. iNetSim
- B. Scylla and OllyDumpEx
- C. Procmon and ProcessExplorer
- D. OllyDbg and IDA Pro

Answer: D

Explanation:

For memory dump analysis, tools like Scylla and OllyDumpEx are more suited. These tools are designed to analyze and extract information from memory dumps, which can be crucial for understanding the state of a system at the time of an incident. Scylla is used for reconstructing imports in dumped binaries, while OllyDumpEx is an OllyDbg plugin used for dumping process memory. Both tools are valuable for incident handlers like Rinni who are performing memory dump analysis to uncover evidence or understand the behavior of malicious software.

NEW QUESTION # 285

In which of the following types of fuzz testing strategies the new data will be generated from scratch and the amount of data to be generated are predefined based on the testing model?

- A. Generation-based fuzz testing
- B. Mutation-based fuzz testing
- C. Log-based fuzz testing
- D. Protocol-based fuzz testing

Answer: C

Explanation:

Generation-based fuzz testing is a strategy where new test data is generated from scratch based on a predefined model that specifies the structure, type, and format of the input data. This approach is systematic and relies on a deep understanding of the format and protocol of the input data to create test cases that are both valid and potentially revealing of vulnerabilities. This contrasts with mutation-based fuzz testing, where existing data samples are modified (mutated) to produce new test cases, and log-based and protocol-based fuzz testing, which use different approaches to test software robustness and security.

References:ECIH v3 certification materials often cover software testing techniques, including fuzz testing, to identify vulnerabilities in applications by inputting unexpected or random data.

NEW QUESTION # 286

Installing a password cracking tool, downloading pornography material, sending emails to colleagues which irritates them and hosting unauthorized websites on the company's computer are considered:

- A. Inappropriate usage incidents
- B. Unauthorized access attacks
- C. Malware attacks
- D. Network based attacks

Answer: A
