- A. If the firewall security policy permits packets to pass, the session table is created.
- **B. If the firewall security policy permits packets to pass, the packets can pass the firewall.**
- C. Packets must pass the firewall, and a session table is established.
- D. By default, when status detection is disabled and the permit policy is configured packets can pass.

Answer: B

Explanation:

In a stateful inspection firewall, if the status detection mechanism is enabled, it tracks and validates the state of connections using the session table. If there is no session table and a SYN+ACK packet reaches the firewall, it checks the security policy. If the policy explicitly permits the packet, it will pass through the firewall, but no session table will be created without the initial SYN packet.
