WGU Practical Applications of Prompt QFO1 Sample Questions (Q18-Q23):

NEW QUESTION # 18

Which prompting technique involves using information from an initial prompt to guide the AI to a second prompt?

- A. Least to most
- B. Cognitive verifier pattern
- C. Generated knowledge
- D. Zero-shot

Answer: C

Explanation:

The Generated Knowledge technique is a two-step optimization process. In the first step, the user asks the AI to generate a set of relevant facts, rules, or background information about a topic. In the second step, this newly "generated knowledge" is incorporated into a follow-up prompt to improve the accuracy of the final answer. This is particularly useful when the AI needs to perform a task that requires specific domain expertise that might not be immediately "top-of-mind" for the model.

For example, if you want the AI to write a medical summary, you might first ask it to "List the current guidelines for treating hypertension" (Generated Knowledge). Then, you use that list in a second prompt:

"Based on these guidelines, evaluate this patient's case." This technique prevents the AI from relying purely on its general training data and instead forces it to use a "grounded" set of facts as a reference point. It is a powerful way to reduce hallucinations because the model is essentially building its own "contextual library" before attempting the main task. This sequential approach ensures that the final output is backed by explicit logic rather than just probabilistic word prediction.

NEW QUESTION # 19

The prompt, "Give me ideas for a birthday party," is created by a parent to help plan for an upcoming birthday party. Which change helps refine the prompt?

- A. Indicate the size of the party
- B. Indicate how soon a response is needed
- C. Explain why the party is being thrown
- D. Give the full name of the child

Answer: A

Explanation:

Refining a prompt involves adding constraints that narrow the range of possibilities to better fit the user's practical reality. Indicating the size of the party is a high-value refinement because it fundamentally changes the nature of the suggestions the AI will generate. Planning a party for five children at home is a radically different logistics task than planning a party for 50 people at a rented venue. By adding the party size, the AI can filter out suggestions that are physically or financially impractical. For example, if the size is "small/intimate," the AI might suggest DIY crafts or board games. If the size is "large/corporate," it might suggest catering options and venue rentals. While knowing "why" the party is thrown (Option A) provides some context, the "how many" (Option B) is a concrete constraint that dictates the feasibility of all subsequent ideas. Providing a child's full name (Option D) is a privacy risk and provides zero functional value to the AI's creative process. Effective refinement focusing on scale and constraints ensures that the AI's output is actionable rather than just imaginative.

NEW QUESTION # 20

Consider the following component of an AI search tool prompt: "Find bike paths near Minneapolis." Which effective prompt component does this demonstrate?

- A. Context
- B. Persona
- C. Instructions
- D. Output format

Answer: C

Explanation:

The phrase "Find bike paths near Minneapolis" functions as the Instructions component of the prompt.

Instructions are the direct commands given to the AI, specifying the primary task that the user wants the system to perform. In any effective prompt, the instruction is the "verb" or the "action" that initiates the AI's processing. Without clear instructions, the AI may understand the subject (bike paths) and the location (Minneapolis) but may not know whether it should list them, map them, describe their history, or compare their difficulty levels.

In this specific case, the word "Find" is the directive. While "Minneapolis" provides a geographical constraint (Context), the core of the statement is the command to locate specific data. Effective prompt engineering relies on being explicit with these instructions to avoid ambiguity. For instance, a more refined instruction might be "Provide a list of..." or "Summarize the locations of..." to further clarify the desired action. However, at its most basic level, this component tells the AI exactly what operation to execute on the provided information, making it the functional heart of the prompt.

NEW QUESTION # 21

What is an advantage of using Personas in prompt engineering?

- A. Greater response speed
- B. Better memory of past conversations
- C. Efficient use of system memory
- D. Highly relevant responses

Answer: D

Explanation:

The primary advantage of using a persona (e.g., "Act as a senior data scientist" or "You are a friendly high school tutor") is the generation of highly relevant responses. A persona acts as a sophisticated filter for the AI's vast training data. When a persona is assigned, the model narrows its focus to the tone, vocabulary, and problem-solving frameworks that are most characteristic of that specific role. This ensures that the output is stylistically and substantively aligned with the user's expectations.

For instance, if you ask for financial advice without a persona, you may get a generic list of tips. If you use the persona of a "conservative financial planner for retirees," the response will prioritize low-risk investments and capital preservation. This relevance is key to professional applications where the "voice" of the output is just as important as the information itself. Personas essentially prime the model's "associative memory" to pull from the most appropriate clusters of data, making the interaction feel more like a consultation with an expert rather than a search query.

NEW QUESTION # 22

Which prompting technique encourages exploration before choosing a most suitable response?

- A. Few-Shot
- B. Generated knowledge
- C. Cognitive verifier pattern
- D. Tree of thought (TOT)

Answer: D

Explanation:

The Tree of Thought (TOT) technique is an advanced prompt engineering framework specifically designed for complex problem-solving. Unlike standard linear prompting, TOT encourages the model to generate multiple "branches" of reasoning or potential solutions simultaneously. It then evaluates these different paths—acting much like a human "brainstorming" session—before deciding

which "branch" is most likely to lead to a successful outcome.

This technique is invaluable for tasks requiring strategic planning or creative exploration where there isn't a single "correct" answer.

By prompting the AI to "think through three different approaches and then select the best one," the user leverages the model's ability to self-critique. While "Few-Shot" provides examples and

"Generated Knowledge" provides facts, TOT provides a logical structure for deliberation. This mimics higher-level cognitive processes and significantly improves the model's performance on difficult reasoning tasks by allowing it to "backtrack" if a certain line of reasoning proves to be a dead end, ultimately leading to a more robust and verified final response.
