After you visit the pages of our product on the websites, you will know the version, price, the quantity of the answers of our product, the update time, 3 versions for you to choose. You can click and see the forms of the answers and the titles and the contents of our AWS Certified Solutions Architect - Professional (SAP-C02) guide torrent. If you feel that it is worthy for you to buy our SAP-C02 Test Torrent you can choose a version which you favor, fill in our mail and choose the most appropriate purchase method and finally pay for our SAP-C02 study tool after you enter in the pay pages on the website. We will send the product to the client by the forms of mails within 10 minutes.

Your final purpose is to get the SAP-C02 certificate. So it is important to choose good study materials. In fact, our aim is the same with you. Our SAP-C02 study materials have strong strengths to help you pass the exam. Maybe you still have doubts about our SAP-C02 exam materials. We have statistics to prove the truth. First of all, our sales volumes are the highest in the market. You can browse our official websites to check our sales volumes. At the same time, many people pass the exam for the first time under the guidance of our SAP-C02 Practice Exam

SAP-C02 Reliable Test Materials & SAP-C02 Dumps Cost

Perhaps you haven't heard of our company's brand yet, although we are becoming a leader of SAP-C02 exam questions in the industry. But it doesn't matter. It's never too late to know it from now on. Our SAP-C02 study guide may not be as famous as other brands for the time being, but we can assure you that we won't lose out on quality. We have free demos of our SAP-C02 Practice Engine that you can download before purchase, and you will be surprised to find its good quality.

Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q348-Q353):

NEW QUESTION # 348

A company has an internal application running on AWS that is used to track and process shipments in the company's warehouse. Currently, after the system receives an order, it emails the staff the information needed to ship a package. Once the package is shipped, the staff replies to the email and the order is marked as shipped.

The company wants to stop using email in the application and move to a serverless application model.

Which architecture solution meets these requirements?

- A. Store new order information in Amazon EFS. Have instances pull the new information from the NFS and send that information to printers in the warehouse. Once the label has been scanned, as it leaves the warehouse, have Amazon API Gateway call the instances to remove the order information from Amazon EFS.
- B. When a new order is created, store the order information in Amazon SQS. Have AWS Lambda check the queue every 5 minutes and process any needed work. When an order needs to be shipped, have Lambda print the label in the warehouse. Once the label has been scanned, as it leaves the warehouse, have an Amazon EC2 instance update Amazon SOS.
- C. Update the application to store new order information in Amazon DynamoDB. When a new order is created, trigger an AWS Step Functions workflow, mark the orders as "in progress," and print a package label to the warehouse. Once the label has been scanned and fulfilled, the application will trigger an AWS Lambda function that will mark the order as shipped and complete the workflow.
- D. Use AWS Batch to configure the different tasks required to ship a package. Have AWS Batch trigger an AWS Lambda function that creates and prints a shipping label. Once that label is scanned, as it leaves the warehouse, have another Lambda function move the process to the next step in the AWS Batch job.B.

Answer: C

NEW QUESTION # 349

A company wants to run a custom network analysis software package to inspect traffic as traffic leaves and enters a VPC. The company has deployed the solution by using AWS Cloud Formation on three Amazon EC2 instances in an Auto Scaling group. All network routing has been established to direct traffic to the EC2 instances.

Whenever the analysis software stops working, the Auto Scaling group replaces an instance. The network routes are not updated when the instance replacement occurs.

Which combination of steps will resolve this issue? (Select THREE.)

- A. Create an AWS Lambda function that responds to the Amazon Simple Notification Service (Amazon SNS) message to take the instance out of service. Update the network routes to point to the replacement instance.
- B. Update the Cloud Formation template to install AWS Systems Manager Agent on the EC2 instances. Configure Systems Manager Agent to send process metrics for the application.
- C. In the Cloud Formation template, write a condition that updates the network routes when a replacement instance is launched.
- D. Create alarms based on EC2 status check metrics that will cause the Auto Scaling group to replace the failed instance.
- E. Create an alarm for the custom metric in Amazon CloudWatch for the failure scenarios. Configure the alarm to publish a message to an Amazon Simple Notification Service (Amazon SNS) topic.
- F. Update the Cloud Formation template to install the Amazon CloudWatch agent on the EC2 instances. Configure the CloudWatch agent to send process metrics for the application.

Answer: A,E,F

NEW QUESTION # 350

A company wants to deploy an AWS WAF solution to manage AWS WAF rules across multiple AWS accounts. The accounts are managed under different OUs in AWS Organizations.

Administrators must be able to add or remove accounts or OUs from managed AWS WAF rule sets as needed. Administrators also must have the ability to automatically update and remediate noncompliant AWS WAF rules in all accounts.

Which solution meets these requirements with the LEAST amount of operational overhead?

- A. Deploy an organization-wide AWS Config rule that requires all resources in the selected OUs to associate the AWS WAF rules. Deploy automated remediation actions by using AWS Lambda to fix noncompliant resources. Deploy AWS WAF rules by using an AWS CloudFormation stack set to target the same OUs where the AWS Config rule is applied.
- B. Create AWS WAF rules in the management account of the organization. Use AWS Lambda environment variables to store account numbers and OUs to manage. Update environment variables as needed to add or remove accounts or OUs. Create cross-account IAM roles in member accounts. Assume the roles by using AWS Security Token Service (AWS STS) in the Lambda function to create and update AWS WAF rules in the member accounts
- **C. Use AWS Firewall Manager to manage AWS WAF rules across accounts in the organization. Use an AWS Systems Manager Parameter Store parameter to store account numbers and OUs to manage. Update the parameter as needed to add or remove accounts or OUs. Use an Amazon EventBridge (Amazon CloudWatch Events) rule to identify any changes to the parameter and to invoke an AWS Lambda function to update the security policy in the Firewall Manager administrative account.**
- D. Use AWS Control Tower to manage AWS WAF rules across accounts in the organization. Use AWS Key Management Service (AWS KMS) to store account numbers and OUs to manage. Update AWS KMS as needed to add or remove accounts or OUs. Create IAM users in member accounts. Allow AWS Control Tower in the management account to use the access key and secret access key to create and update AWS WAF rules in the member accounts.

Answer: C

Explanation:

In this solution, AWS Firewall Manager is used to manage AWS WAF rules across accounts in the organization. An AWS Systems Manager Parameter Store parameter is used to store account numbers and OUs to manage. This parameter can be updated as needed to add or remove accounts or OUs. An Amazon EventBridge rule is used to identify any changes to the parameter and to invoke an AWS Lambda function to update the security policy in the Firewall Manager administrative account. This solution allows for easy management of AWS WAF rules across multiple accounts with minimal operational overhead.

NEW QUESTION # 351

Question:

How can a company patch EC2 instances without internet access, using a patch source in another account, while accessing Systems Manager and S3?

- A. Network ACLs + Transit Gateway
- B. Custom VPN servers
- **C. VPC endpoints + VPC peering with patch source**
- D. Transit Gateway + private VIFs

Answer: C

Explanation:

The most secure and manageable solution is to use VPC interface endpoints for S3 and Systems Manager, and establish VPC peering to privately access the patch repo in the core account.

#Systems Manager VPC setup

NEW QUESTION # 352

A company runs a customer service center that accepts calls and automatically sends all customers a managed, interactive, two-way experience survey by text message. The applications that support the customer service center run on machines that the company hosts in an on-premises data center. The hardware that the company uses is old, and the company is experiencing downtime with the system. The company wants to migrate the system to AWS to improve reliability.

Which solution will meet these requirements with the LEAST ongoing operational overhead?

- A. Use Amazon Connect to replace the old call center hardware. Use Amazon Simple Notification Service (Amazon SNS) to send text message surveys to customers.
- **B. Use Amazon Connect to replace the old call center hardware. Use Amazon Pinpoint to send text message surveys to customers.**
- C. Use Amazon Pinpoint to replace the old call center hardware and to send text message surveys to customers.

- D. Migrate the call center software to Amazon EC2 instances that are in an Auto Scaling group. Use the EC2 instances to send text message surveys to customers.

Answer: B

Explanation:

The solution that will meet the company's requirements with the LEAST ongoing operational overhead and send two-way experience survey is to use Amazon Connect to replace the old call center hardware and use Amazon Pinpoint to send text message surveys to customers. Amazon Connect is a fully managed, cloud-based contact center service that is easy to set up and configure, while Amazon Pinpoint can be used to send text message surveys and gather responses. By using these services, the company can offload the operational overhead of running and maintaining the call center hardware and survey system to AWS.
