PCCP Latest Test Answers | PCCP Reliable Test Labs

In order to facilitate the wide variety of users' needs the PCCP study guide have developed three models with the highest application rate in the present - PDF, software and online. Online mode of another name is App of study materials, it is developed on the basis of a web browser, as long as the user terminals on the browser, can realize the application which has applied by the PCCP simulating materials of this learning model, users only need to open the App link, you can quickly open the learning content in real time in the ways of the PCCP study materials.

Hundreds of candidates want to get the Palo Alto Networks Certified Cybersecurity Practitioner (PCCP) certification exam because it helps them in accelerating their Palo Alto Networks careers. Cracking the PCCP exam of this credential is vital when it comes to the up gradation of their resume. The PCCP Certification Exam helps students earn from online work and it also benefits them in order to get a job in any good tech company.

We have designed a chat window below the web page. Once you want to ask some questions about the PCCP training engine, you can click the little window. Then you just need to click the buttons after writing your email address and your questions about the PCCP Exam Questions. Our back operation system will soon receive your email; then you will get a quick feedback on the PCCP practice braindumps from our online workers.

Palo Alto Networks Certified Cybersecurity Practitioner Sample Questions (Q157-Q162):

NEW QUESTION # 157
Which type of system collects data and uses correlation rules to trigger alarms?

- A. SIM

- B. SOAR
- C. SIEM
- D. UEBA

Answer: C

Explanation:
A Security Information and Event Management (SIEM) system collects data from various sources (logs, events, etc.) and uses correlation rules to analyze this data and trigger alarms when suspicious or predefined patterns are detected.

NEW QUESTION # 158

If an endpoint does not know how to reach its destination, what path will it take to get there?

- A. The endpoint will send data to the specified default gateway.
- B. The endpoint will broadcast to all connected network devices.
- C. The endpoint will not send the traffic until a path is clarified.
- D. The endpoint will forward data to another endpoint to send instead.

Answer: A

Explanation:
If an endpoint does not know how to reach its destination, it will send data to the specified default gateway.
A default gateway is a device that routes traffic from a local network to other networks or the internet. The endpoint will use the default gateway's IP address as the next hop for packets that are destined for unknown or remote networks. The default gateway will then forward the packets to the appropriate destination or another gateway, based on its routing table. References:

* PCCET Study Guide, Section 2.2: Describe IP Addressing and Routing2

NEW QUESTION # 159

In which two cloud computing service models are the vendors responsible for vulnerability and patch management of the underlying operating system? (Choose two.)

- A. IaaS
- B. On-premises
- C. PaaS
- D. SaaS

Answer: C,D

Explanation:
In cloud computing, there are three main service models: Software as a Service (SaaS), Platform as a Service (PaaS), and Infrastructure as a Service (IaaS). Each model defines the level of responsibility and control that the cloud provider and the cloud customer have over the cloud resources and services. The cloud provider is responsible for vulnerability and patch management of the underlying operating system in SaaS and PaaS models, while the cloud customer is responsible for it in IaaS model. In SaaS, the cloud provider delivers software applications over the internet and manages all aspects of the cloud infrastructure, platform, and application. The cloud customer only needs to access the software through a web browser or an API. In PaaS, the cloud provider offers a platform for developing, testing, and deploying applications and manages the cloud infrastructure and operating system. The cloud customer can use the platform tools and services to create and run their own applications. In IaaS, the cloud provider supplies the basic cloud infrastructure, such as servers, storage, and networking, and the cloud customer can provision and configure their own operating system, middleware, and applications. NEW QUESTION # 160

How does Cortex XSOAR Threat Intelligence Management (TIM) provide relevant threat data to analysts?

- A. It creates an encrypted connection to the company's data center.
- B. II prevents sensitive data from leaving the network.
- C. It performs SSL decryption to give visibility into user traffic.

- D. II automates the ingestion and aggregation of indicators.

Answer: D

Explanation:
Cortex XSOAR Threat Intelligence Management (TIM) is a platform that enables security teams to manage the lifecycle of threat intelligence, from aggregation to action. One of the key features of Cortex XSOAR TIM is that it automates the ingestion and aggregation of indicators from various sources, such as threat feeds, open-source intelligence, internal data, and third-party integrations 1. Indicators are pieces of information that can be used to identify malicious activity, such as IP addresses, domains, URLs, hashes, etc. By automating the ingestion and aggregation of indicators, Cortex XSOAR TIM reduces the manual effort and time required to collect, validate, and prioritize threat data. It also enables analysts to have a unified view of the global threat landscape and the impact of threats on their network 1. References: 1: Threat Intelligence Management

NEW QUESTION # 161
Which next-generation firewall (NGFW) deployment option provides full application visibility into Kubernetes environments?

- A. Virtual
- B. SASE
- C. Container
- D. Physical

Answer: C

Explanation:
A container-based NGFW is specifically designed to integrate with Kubernetes environments, providing full application visibility and control within containerized workloads. It operates at the pod level, making it ideal for securing dynamic microservices architectures.
