Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q74-Q79):

NEW QUESTION # 74

How would an administrator schedule automatic backups of a volume using Portworx?

- A. Use a cron job to execute pxctl snapshot create.
- **B. Configure and apply schedule policies.**
- C. Execute px backup volume.

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Portworx provides a declarative method to schedule automatic backups by configuring schedule policies within its Backup and DR framework. These policies specify when and how frequently backups should occur, retention rules, and target storage locations. By applying schedule policies, administrators enable Portworx to perform backups automatically without manual intervention or external scripting. Using cron jobs to run pxctl snapshot create is possible but less integrated, error-prone, and not recommended for scalable environments. The command px backup volume is not a valid Portworx CLI command. The Portworx backup documentation encourages using native schedule policies for reliable, maintainable, and policy-driven backup automation, supporting compliance and disaster recovery strategies **【Pure Storage Portworx Backup Guide source】**.

NEW QUESTION # 75

A Portworx administrator wants to create a storage class that can be used to create volumes with the following characteristics:

* Encrypted volume

* Two replicas

Which definition should the administrator use?

- **A. kind: StorageClass**
apiVersion: storage.k8s.io/v1
metadata:
name: px-encrypted
provisioner: kubernetes.io/portworx-volume
parameters:
encrypted: "true"
repl: "2"
- B. kind: StorageClass
apiVersion: storage.k8s.io/v1
metadata:
name: px-encrypted
provisioner: kubernetes.io/portworx-volume
parameters:
secure: "true"
repl: "2"
- C. kind: StorageClass
apiVersion: storage.k8s.io/v1
metadata:
name: px-encrypted
provisioner: kubernetes.io/portworx-volume
parameters:
sharedv4: "true"
repl: "2"

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To create a StorageClass in Kubernetes for Portworx volumes that are encrypted and replicated twice, the correct parameters are encrypted: "true" to enable encryption and repl: "2" to specify two replicas. Option A accurately sets these parameters, ensuring volumes provisioned with this StorageClass will be encrypted at rest and maintain two replicas for data redundancy. Option B uses sharedv4: "true", which relates to NFS-like sharing, not encryption. Option C uses secure: "true", which is not the recognized parameter for enabling encryption in Portworx StorageClass definitions. The official Portworx StorageClass parameter documentation confirms encrypted as the correct flag for encryption and repl to specify replication factor, enabling administrators to enforce data security and availability policies declaratively through Kubernetes manifests **【Pure Storage Portworx StorageClass Guide source】**.

NEW QUESTION # 76

What information is included in the Portworx diagnostics bundle (diags)?

- A. Application logs, Kubernetes events, and network configurations
- B. User activity logs, security policies, and firewall rules
- **C. Portworx journal logs, CLI command outputs, and basic OS information**

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The Portworx diagnostics bundle, known as "diags," aggregates comprehensive diagnostic data for troubleshooting. This includes Portworx journal logs, which record detailed system and service events essential for identifying errors or malfunctions. Additionally, the bundle contains outputs from key CLI commands such as pxctl status and pxctl volume list that provide snapshots of the cluster's health, volume states, and configuration at the time of collection. Basic operating system

information, including kernel version, disk hardware details, and network interfaces, is also captured to understand the underlying environment. Together, these components equip Portworx support and administrators with the contextual data needed for effective root cause analysis and faster issue resolution. The official Portworx support documentation recommends collecting and submitting this bundle for all significant troubleshooting cases as it expedites problem diagnosis and resolution 【Pure Storage Portworx Support Guide source】.

NEW QUESTION # 77

Which command could be used to install Portworx on Kubernetes using the PX-Operator?

- A. `kubectl apply -f "https://install.portworx.com/<portworx_version>?comp=pxoperator&kbver=<k8s-version>&ns=portworx"`
- B. `kubectl apply -f "https://install.portworx.com/<portworx_version>?operator=true&mc=false&kbver=1.25.0&ns=portworx&b=true&kd=type%3Dgpg%2Csize%3D150&s=%2F%2F22type%3Dgpg%2Csize%3D150&c=px-cluster-0584f7fb-b6be-4608-800c-2ac5fb8069e0&stork=true&csi=true&mon=true&tel=false&st=k8s&promop=true"`
- C. `curl -O px-ag-install.sh -L "https://install.portworx.com/$PXVER/air-gapped?kbver=$KBVER"`

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The officially recommended method to install Portworx with Kubernetes Operator support is using the PX-Operator manifest. This is done by applying the manifest URL with the `comp=pxoperator` parameter. The command:

`kubectl apply -f "https://install.portworx.com/<portworx_version>?comp=pxoperator&kbver=<k8s-version>&ns=portworx"` deploys the Portworx Operator, which manages Portworx lifecycle operations such as installation, upgrades, and configuration changes within the Kubernetes cluster. Specifying the Kubernetes version (kbver) and namespace (ns) ensures compatibility and proper scoping. This operator-centric installation enables more efficient management and automation compared to standalone scripts or manual installations. Portworx official operator installation documentation confirms this approach as the best practice for production deployments, streamlining Portworx management in Kubernetes environments 【Pure Storage Portworx Operator Installation Guide source】.

NEW QUESTION # 78

An administrator deploys Portworx in the "portworx" namespace.

What command should the administrator use to check status of only the Portworx pods?

- A. `kubectl -n portworx get storagecluster`
- B. `kubectl -n portworx get pods -o wide`
- C. `kubectl -n portworx get pods -l name=portworx`

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To view the status of only Portworx pods within the "portworx" namespace, administrators should use label selectors with `kubectl`. The command `kubectl -n portworx get pods -l name=portworx` filters pods by the label `name=portworx`, showing only pods related to the Portworx deployment. This is more precise than simply listing all pods with `-o wide`, which includes unrelated pods. Checking Portworx pods' status is crucial for monitoring cluster health, identifying pod restarts, or troubleshooting failures. The Portworx installation manifests and documentation specify labels applied to Portworx pods, enabling operators to filter efficiently. Using this command supports focused operational monitoring and streamlined debugging within Kubernetes environments running Portworx 【Pure Storage Portworx Kubernetes Guide source】.
