

Quiz Newest TDA-C01 - Reliable Tableau Certified Data Analyst Test Blueprint

What's more, part of that Exam4Labs TDA-C01 dumps now are free: <https://drive.google.com/open?id=15rSVDpZvIXITCHVIPstS7kU75dhBM-A1>

It is a challenging exam and not a traditional exam. But complete Tableau TDA-C01 exam preparation can enable you to crack the Tableau TDA-C01 exam easily. For the quick and complete Tableau Certified Data Analyst (TDA-C01) exam preparation you can trust TDA-C01 Exam Practice test questions. The Tableau TDA-C01 exam practice test questions have already helped many Tableau TDA-C01 exam candidates in their preparation and success.

Tableau is a leading data visualization and analysis software that helps organizations in gaining significant insights from large and complex datasets. Certified Tableau Data Analysts command a higher salary than non-certified ones in the job market, and this certification serves to validate their skills and knowledge to potential employers.

Tableau TDA-C01 certification exam tests candidates on various topics, including data visualization, data analysis, and data management. Candidates are required to demonstrate their ability to use Tableau to create dashboards, analyze data, and create insights that can be used for making business decisions. TDA-C01 exam is designed to test candidates' practical skills in using Tableau, and it is structured to ensure that candidates have a good understanding of Tableau's features and functionalities.

The Tableau TDA-C01 Exam covers a wide range of topics, including data connections, data visualization, calculations, mapping, and data analysis. Candidates are expected to have a solid understanding of data analysis techniques and be able to use Tableau software to create interactive dashboards and reports that effectively communicate insights from data. TDA-C01 exam also assesses candidates' ability to manipulate data using Tableau Prep, a tool that allows users to clean, reshape, and combine data from multiple sources.

NEW QUESTION # 107

You have the following dashboard that contains two sheets.

You want to minimize the whitespace between the sheets.

What should you configure?

- A. The padding
- B. The size
- C. The position
- D. The background
- E. The border

Answer: A

Explanation:

To minimize the whitespace between the sheets, you should configure the padding of the sheets and the dashboard. Padding is the amount of space between the edge of a sheet or dashboard and its content. You can adjust the padding by using the Layout tab in the Format pane. You can reduce the padding for each sheet by selecting the sheet and changing the values for the inner and outer padding. You can also reduce the padding for the dashboard by selecting the dashboard and changing the values for the outer padding. Reducing the padding will make the sheets and the dashboard more compact and eliminate unnecessary whitespace.

NEW QUESTION # 108

A Data Analyst needs to calculate the first Tuesday of each month in the data.

Which set of functions should the analyst use to perform this calculation?

- A. DATEADD, DATENAME
- B. DATETRUNC, DATEADD
- C. DATETRUNC, DATEPART
- D. DATEDIFF, DATEPART

Answer: C

NEW QUESTION # 109

You want to create the following dashboard.

The dashboard will contain two sheets that will connect to the same data source. The top sheet will be configured to filter the bottom sheet.

When you click a category on the top sheet, the sheets must resize as shown in the following exhibit.

How should you lay out the objects on the dashboard?

- A. Drag a horizontal container to the dashboard and add both sheets to the container. Set the Fit to Standard.
- B. Drag a blank object to the dashboard and add both sheets to the dashboard. Set Fit to Entire view.
- C. Add both sheets to the dashboard. Set Fit to Fix width.
- D. **Drag a vertical container to the dashboard and add both sheets to the container. Set Fit to Entire view.**

Answer: D

Explanation:

To create the dashboard as shown in the image, you need to use a vertical layout container that will adjust the height of the sheets according to the window size. You also need to set the Fit to Entire view option for both sheets so that they will resize proportionally when you click a category on the top sheet. This way, you can achieve the desired effect of having the bottom sheet expand to fill the space left by the top sheet when it filters out some categories. References:

NEW QUESTION # 110

You have the Mowing two tables that contains data about the books in a library.

Both tables are incomplete so there are books missing from the tables.

You need to combine the tables. The solution must ensure that all the data is retained Which type of join should you use?

- A. Right join
- **B. Full outer join**
- C. left join
- D. Inner join

Answer: B

Explanation:

To combine the two tables that contain data about books in a library and ensure that all the data is retained, you should use a full outer join. A full outer join is a type of join that returns all rows from both tables, regardless of whether there is a match or not. If there is no match, null values are filled in for the missing fields.

To perform a full outer join, you need to do the following steps:

Connect to both tables as your data sources in Tableau. You can use either live or extract connections.

Drag one table to the canvas and drop it on top of another table. This will create a join between them based on a common field. Click on the join icon between the tables and select Full Outer Join from the drop-down list. This will change the join type to full outer join and show all rows from both tables.

Optionally, you can add or remove join clauses by clicking on Add or Remove buttons next to each clause. You can also change or rename fields by clicking on them.

The other types of joins are not correct for this scenario. An inner join returns only the rows that have a match in both tables, which will exclude any books that are missing from either table. A left join returns all rows from the left table and only the matching rows from the right table, which will exclude any books that are only in the right table. A right join returns all rows from the right table and only the matching rows from the left table, which will exclude any books that are only in the left table. Reference:
