

Ping Identity PAP-001 Real Dump, PAP-001 Related Content

What's more, part of that PremiumVCEDump PAP-001 dumps now are free: <https://drive.google.com/open?id=1jpsLwWfvBCvulJOyB7x7hcepOnzwCgwp>

If you want to quickly study PAP-001 exam questions, printed in the manuscripts to convenient their record at any time, you can choose to PDF model of PAP-001 guide torrent Simulated test, of course, if you want to achieve online, real-time test their learning effect, our PAP-001 study quiz will provide you the Software model, it can make you better in the real test environment to exercise your ability to solve the problem and speed. Finally, if you think that you want to practice with other electronic devices, you can choose the PAP-001 practice materials by using Online version.

Ping Identity PAP-001 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Integrations: This section of the exam measures skills of System Engineers and explains how PingAccess integrates with token providers, OAuth and OpenID Connect configurations, and site authenticators. It also includes the use of agents and securing web, API, and combined applications through appropriate integration settings.
Topic 2	<ul style="list-style-type: none">• Product Overview: This section of the exam measures skills of Security Administrators and focuses on understanding PingAccess features, functionality, and its primary use cases. It also covers how PingAccess integrates with other Ping products to support secure access management solutions.
Topic 3	<ul style="list-style-type: none">• Installation and Initial Configuration: This section of the exam measures skills of System Engineers and reviews installation prerequisites, methods of installing or removing PingAccess, and securing configuration database passwords. It explains the role of run.properties entries and outlines how to set up a basic on-premise PingAccess cluster.

Topic 4	<ul style="list-style-type: none"> • General Configuration: This section of the exam measures skills of Security Administrators and introduces the different object types within PingAccess such as applications, virtual hosts, and web sessions. It explains managing application resource properties, creating web sessions, configuring identity mappings, and navigating the administrative console effectively.
Topic 5	<ul style="list-style-type: none"> • Security: This section of the exam measures skills of Security Administrators and highlights how to manage certificates and certificate groups. It covers the association of certificates with virtual hosts or listeners and the use of administrator roles for authentication management.
Topic 6	<ul style="list-style-type: none"> • Policies and Rules: This section of the exam measures the skills of Security Administrators and focuses on how PingAccess evaluates paths for applying policies and resources. It covers the role of different rule types, their configuration, and the implementation of rule sets and rule set groups for consistent policy enforcement.

High Pass Rate PAP-001 Exam Guide - PAP-001 Latest Practice Dumps

Many people prefer to buy our PAP-001 valid study guide materials because they deeply believe that if only they buy them can definitely pass the PAP-001 test. The reason why they like our PAP-001 guide questions is that our study materials' quality is very high and the service is wonderful. For years we always devote ourselves to perfecting our PAP-001 Study Materials and shaping our products into the model products which other companies strive hard to emulate. We boost the leading research team and the top-ranking sale service.

Ping Identity Certified Professional - PingAccess Sample Questions (Q44-Q49):

NEW QUESTION # 44

An administrator needs to prevent PingAccess from automatically starting on a Windows Server. Which command would accomplish this task?

- A. **uninstall-service.bat**
- B. init.bat
- C. remove-install.bat
- D. wrapper-service.bat

Answer: A

Explanation:

PingAccess installs as a Windows service. To remove or prevent automatic startup, the `uninstall-service.bat` script is used.

Exact Extract:

"On Windows, use `install-service.bat` to install PingAccess as a service and `uninstall-service.bat` to remove the service."

- * Option A (`init.bat`) initializes environment variables but does not manage services.
- * Option B (`uninstall-service.bat`) is correct - it removes the Windows service, preventing auto-start.
- * Option C (`remove-install.bat`) is not a valid PingAccess script.
- * Option D (`wrapper-service.bat`) configures wrapper options, not service removal.

Reference: PingAccess Installation Guide - Windows Service Scripts

NEW QUESTION # 45

What is the purpose of the `admin.authconfiguration` setting?

- A. **To override the SSO configuration for the administrative user interface.**
- B. To define the method to use for authenticating to the administrative API.
- C. To configure SSO for the administrative user interface.
- D. To enable automatic authentication to the PingAccess administrative console.

Answer: A

Explanation:

The `admin.auth.setting` in the `run.properties` file is used to specify a fallback authentication method for the administrative console.

Exact Extract from official documentation:

"To define a fallback administrator authentication method if the OIDC token provider is unreachable, enable the `admin.auth=native` property in the `run.properties` file. This overrides any configured administrative authentication to basic authentication." This makes it clear that the purpose of `admin.auth` is to override any configured SSO for the admin UI and enforce native (basic) authentication instead.

* Option A is incorrect because the `admin.auth.setting` does not configure SSO. SSO for the admin UI is configured separately.

* Option B is incorrect because this setting does not apply to the administrative API; it specifically applies to the admin UI console.

* Option C is correct because it directly reflects the documented behavior: `admin.auth` overrides SSO configuration for the administrative UI and enables native authentication.

* Option D is incorrect because the setting does not enable automatic authentication. It still requires credentials, but falls back to basic auth.

Reference: PingAccess User Interface Reference Guide - Configuring Admin UI SSO Authentication

NEW QUESTION # 46

Developers report an issue with an application that is protected by PingAccess. Certain requests are not providing claims that are part of the access token.

What should the administrator add for the access token claims?

- **A. An OAuth attribute rule**
- B. An identity mapping definition
- C. A web session attribute rule
- D. An authentication requirement definition

Answer: A

Explanation:

In PingAccess, when an application relies on claims from an OAuth access token, you must configure PingAccess to evaluate those claims and potentially inject them into headers for the backend application.

* Exact Extract from PingAccess documentation:

"OAuth rules allow you to evaluate claims in OAuth access tokens. You can configure PingAccess to look at specific claims and enforce policies or pass them to target applications."

"To extract attributes from an access token, configure an OAuth Attribute Rule." This clearly matches option D.

Analysis of each option:

* A. An authentication requirement definition

* Incorrect. Authentication requirements determine how users authenticate to applications (OIDC provider, etc.), but do not manage access token claims.

* B. A web session attribute rule

* Incorrect. Web session attribute rules map attributes from the authenticated user's web session (SSO session), not from OAuth access tokens.

* C. An identity mapping definition

* Incorrect. Identity mappings transform user attributes (from IdP to app), but they don't directly pull claims from OAuth tokens.

* D. An OAuth attribute rule

* Correct. This rule is specifically designed to extract and enforce policies on claims from OAuth access tokens.

Therefore, the correct answer is D. An OAuth attribute rule.

Reference: PingAccess Administration Guide - Rules # OAuth Attribute Rules.

NEW QUESTION # 47

A financial application should be prompted for step-up authentication on a URL that allows money transfers.

A previous administrator configured rules to be applied on the required application URL. Users are not prompted for step-up authentication when accessing the `/sra/femmeneyURL` endpoint.

Which two actions should the administrator take? (Choose 2 answers.)

- A. Make sure that the existing rule's token validation contains the appropriate minimum authentication requirements
- B. Verify that a rejection handler rule exists and is applied to the application to see if a user has met the required authentication context

- C. Make sure that the existing rule's authentication requirements contain the appropriate minimum authentication requirements
- D. Verify that an authentication requirement rule is applied to the application to see if a user has met the required authentication context
- E. Create a new identity mapping containing authentication context values and add the mapping to the existing rule

Answer: C,D

Explanation:

Step-up authentication in PingAccess is enforced through Authentication Requirement Rules. If users are not prompted, the likely issues are:

- * The rule is missing from the application/resource.
- * The rule's minimum authentication context does not include MFA.

Exact Extract:

"Authentication requirement rules determine whether PingAccess will challenge a user with additional authentication (such as MFA). Ensure that the rule is applied to the resource and that the authentication context is set correctly."

- * Option A is incorrect - rejection handlers define error handling, not MFA enforcement.
- * Option B is correct - verify the authentication requirement rule is applied.
- * Option C is correct - ensure the rule contains the right MFA requirements.
- * Option D is incorrect - identity mappings do not enforce step-up authentication.
- * Option E is incorrect - token validation rules check validity, not MFA levels.

Reference: PingAccess Administration Guide - Authentication Requirements

NEW QUESTION # 48

An application requires MFA for URLs that are considered high risk. Which action should the administrator take to meet this requirement?

- A. Apply a Web Session Attribute rule to the resource.
- B. Apply an Authentication Requirements rule to the resource.
- C. Create an Authentication Requirement named MFA_Required.
- D. Apply an HTTP Request Parameter rule to the resource.

Answer: B

Explanation:

PingAccess allows fine-grained authentication enforcement by applying Authentication Requirement rules at the resource level. These rules can invoke MFA flows based on request context or policy.

Exact Extract:

"Authentication requirement rules determine whether PingAccess challenges a user to authenticate again (for example, with MFA) before allowing access to a protected resource."

- * Option A is incomplete. Creating a requirement does nothing unless it is applied.
- * Option B is correct because applying the Authentication Requirement rule to the specific resource (URL) enforces MFA only for that resource.
- * Option C is incorrect; Web Session Attribute rules are about evaluating existing session attributes, not triggering MFA.
- * Option D is incorrect; HTTP Request Parameter rules are used to evaluate request data, not enforce MFA policies.
