

# Quiz Docker - DCA - Fantastic Docker Certified Associate (DCA) Exam Study Materials Review

P.S. Free 2026 Docker DCA dumps are available on Google Drive shared by Pass4sures: [https://drive.google.com/open?id=1CYS-GEcmV0cosi5\\_LD-0YSzNbdk6nlt](https://drive.google.com/open?id=1CYS-GEcmV0cosi5_LD-0YSzNbdk6nlt)

In this cut-throat competitive world of Docker, the Docker DCA certification is the most desired one. But what creates an obstacle in the way of the aspirants of the Docker Certified Associate (DCA) Exam (DCA) certificate is their failure to find up-to-date, unique, and reliable Docker Certified Associate (DCA) Exam (DCA) practice material to succeed in passing the Docker DCA certification exam.

Competition appear everywhere in modern society. There are many way to improve ourselves and learning methods of DCA exams come in different forms. Economy rejuvenation and social development carry out the blossom of technology; some DCA practice materials are announced which have a good quality. Certification qualification DCA Exam Materials are a big industry and many companies are set up for furnish a variety of services for it. And our DCA study guide has three different versions: PDF, Soft and APP versions to let you study in varied and comfortable ways.

### Customize Your Docker DCA Practice Exam for Better Results

Thousands of Docker Certified Associate (DCA) Exam (DCA) exam applicants are satisfied with our DCA practice test material because it is according to the latest Docker Certified Associate (DCA) Exam (DCA) exam syllabus and we also offer up to 1 year of free Docker Dumps updates. Visitors of Pass4sures can check the Docker Certified Associate (DCA) Exam (DCA) product by trying a free demo. Buy the DCA test preparation material now and start your journey towards success in the Docker Certified Associate (DCA) Exam (DCA) examination.

### Docker Certified Associate (DCA) Exam Sample Questions (Q130-Q135):

#### NEW QUESTION # 130

Is this statement correct?

Solution. A Dockerfile stores persistent data between deployments of a container

- A. No
- B. Yes

**Answer: A**

**Explanation:**

= A Dockerfile does not store persistent data between deployments of a container. A Dockerfile is a text document that contains instructions for building a Docker image. A Docker image is a read-only template that defines the layers and configuration of a container. A Docker container is an isolated and ephemeral instance of a Docker image that runs on the Docker Engine. Docker containers are not meant to store persistent data, as any changes made to the container's filesystem are lost when the container is removed. To store persistent data between deployments of a container, you need to use volumes or bind mounts. Volumes and bind

mounts are ways to attach external storage to a container, so that the data is preserved even if the container is deleted. Volumes are managed by Docker and stored in a location on the host system that is independent of the container's lifecycle. Bind mounts are files or directories on the host system that are mounted into a container. References:

### NEW QUESTION # 131

Will this command mount the host's '/data\*' directory to the ubuntu container in read-only mode?

Solution: 'docker run -add-volume /data /mydata -read-only ubuntu'

- A. No
- B. Yes

**Answer: A**

Explanation:

Explanation

= The command `docker run -add-volume /data /mydata -read-only ubuntu` will not mount the host's /data directory to the ubuntu container in read-only mode. The reason is that the command has several syntax errors and invalid options. The correct command to mount a host directory to a container in read-only mode is `docker run --mount type=bind,source=/data,target=/mydata,readonly ubuntu`<sup>12</sup>. The command `docker run -add-volume /data /mydata -read-only ubuntu` has the following problems:

\* The option `-add-volume` is not a valid option for docker run. The valid options for mounting a volume or a bind mount are `--mount` or `-v`<sup>12</sup>.

\* The option `-read-only` is not a valid option for docker run. The valid option for making the container's root filesystem read-only is `--read-only`<sup>3</sup>. However, this option will not affect the mounted volumes or bind mounts, which have their own `readonly` option<sup>12</sup>.

\* The argument `/data /mydata` is not a valid argument for docker run. The argument for docker run should be the command to run inside the container, such as `bash` or `ping`<sup>4</sup>. The source and target of the volume or bind mount should be specified in the `--mount` or `-v` option, separated by a colon<sup>12</sup>.

Therefore, the command `docker run -add-volume /data /mydata -read-only ubuntu` will not work as intended, and will likely produce an error message or an unexpected result. References:

- \* Use bind mounts
- \* Use volumes
- \* docker run
- \* Docker run reference

### NEW QUESTION # 132

A company's security policy specifies that development and production containers must run on separate nodes in a given Swarm cluster.

Can this be used to schedule containers to meet the security policy requirements?

Solution: label constraints

- A. No
- B. Yes

**Answer: B**

Explanation:

Explanation

Label constraints can be used to schedule containers to meet the security policy requirements. Label constraints allow you to specify which nodes a service can run on based on the labels assigned to the nodes<sup>1</sup>.

For example, you can label the nodes that are intended for development with `env=dev` and the nodes that are intended for production with `env=prod`. Then, you can use the `--constraint` flag when creating a service to restrict it to run only on nodes with a certain label value. For example, `docker service create --name dev-app`

`--constraint 'node.labels.env == dev' ...` will create a service that runs only on development nodes<sup>2</sup>. Similarly, `docker service create --name prod-app --constraint 'node.labels.env == prod' ...` will create a service that runs only on production nodes<sup>3</sup>. This way, you can ensure that development and production containers are running on separate nodes in a given Swarm cluster. References:

- \* Add labels to swarm nodes
- \* Using placement constraints with Docker Swarm
- \* Multiple label placement constraints in docker swarm

### NEW QUESTION # 133

In the context of a swarm mode cluster, does this describe a node?

Solution: a physical machine participating in the swarm

- A. No
- **B. Yes**

**Answer: B**

Explanation:

A node is a physical or virtual machine running Docker Engine in swarm mode<sup>1</sup>. A node can be either a manager or a worker, depending on its role in the cluster<sup>1</sup>. A physical machine participating in the swarm is a node, regardless of its role or availability<sup>2</sup>.

- \* Manage nodes in a swarm | Docker Docs

### NEW QUESTION # 134

Will this command ensure that overlay traffic between service tasks is encrypted?

Solution: docker service create --network --secure

- **A. No**
- B. Yes

**Answer: A**

Explanation:

Explanation

This command will not ensure that overlay traffic between service tasks is encrypted, because it uses an invalid option for enabling encryption and an incomplete option for specifying the network. According to the official documentation, there is no such option as --secure for the docker service create command. The correct option to use is --network <network-name> where <network-name> is an existing overlay network that was created with encryption enabled.
