Amazon AWS Certified Cloud Practitioner Sample Questions (Q308-Q313):

NEW QUESTION # 308
A company needs to run its existing custom, nonproduction workloads in the AWS Cloud quickly and cost-effectively.
The workloads can recover from interruptions easily.
Which pricing model should the company use?

- A. On-Demand Instances
- B. Spot Instances
- C. Dedicated Hosts
- D. Reserved Instances

Answer: B

Explanation:
The correct answer is C because Spot Instances are the pricing model that enables the company to run its existing custom, nonproduction workloads in the AWS Cloud quickly and cost-effectively. Spot Instances are spare Amazon EC2 instances that are available at up to 90% discount compared to On-Demand prices. Spot Instances are suitable for stateless, fault-tolerant, and flexible workloads that can recover from interruptions easily. The other options are incorrect because they are not the pricing model that enables the company to run its existing custom, nonproduction workloads in the AWS Cloud quickly and cost-effectively. Reserved Instances are Amazon EC2 instances that are reserved for a specific period of time (one or three years) in exchange for a lower hourly rate. Reserved Instances are suitable for steady-state or predictable workloads that run for a long duration. On-Demand Instances are Amazon EC2 instances that are launched and billed at a fixed hourly rate. On-Demand Instances are suitable for short-term, irregular, or unpredictable workloads that cannot be interrupted. Dedicated Hosts are physical servers that are dedicated to a single customer. Dedicated Hosts are suitable for workloads that require regulatory compliance or data isolation. Reference: Amazon EC2 Instance Purchasing Options

NEW QUESTION # 309
How does the AWS Enterprise Support Concierge team help users?

- A. Providing architecture guidance
- B. Answering billing and account inquiries
- C. Supporting application development
- D. Answering questions regarding technical support cases

Answer: B

Explanation:
The AWS Enterprise Support Concierge team is a group of billing and account experts who specialize in working with enterprise customers. They can help customers with questions about billing, account management, cost optimization, and other non-technical issues. They can also assist customers with navigating and optimizing their AWS environment, such as setting up consolidated billing, applying for service limit increases, or requesting refunds.

NEW QUESTION # 310

Which AWS service gives users the ability to discover and protect sensitive data that is stored in Amazon S3 buckets?

- A. AWS I AM Access Analyzer
- B. Amazon Detective
- C. Amazon GuardDuty
- D. Amazon Macie

Answer: D

Explanation:
Amazon Macie is a data security and privacy service offered by AWS that uses machine learning and pattern matching to discover the sensitive data stored within Amazon S3. You can define your own custom type of sensitive data category that might be unique to your business or use case. Macie also provides you with dashboards and alerts that give you visibility into how your data is being accessed or moved. Macie helps you protect your data by enabling you to apply data protection techniques such as encryption, deletion, access control, and auditing. NEW QUESTION # 311
A company's IT team is managing MySQL database server clusters. The IT team has to patch the database and take backup snapshots of the data in the clusters. The company wants to move this workload to AWS so that these tasks will be completed automatically.
What should the company do to meet these requirements?

- A. Use Amazon RDS with a MySQL database.
- B. Use an AWS CloudFormation template to deploy MySQL database servers on Amazon EC2 instances.
- C. Migrate all the MySQL database data to Amazon S3.
- D. Deploy MySQL database server clusters on Amazon EC2 instances.

Answer: A

Explanation:
Amazon RDS is a service that makes it easy to set up, operate, and scale a relational database in the cloud.
Amazon RDS supports MySQL as one of the database engines. By using Amazon RDS with a MySQL database, the company can offload the tasks of patching the database and taking backup snapshots to AWS.
Amazon RDS automatically patches the database software and operating system of the database instances.
Amazon RDS also automatically backs up the database and retains the backups for a user-defined retention period. The company can also restore the database to any point in time within the retention period. Deploying MySQL database server clusters on Amazon EC2 instances, using an AWS CloudFormation template to deploy MySQL database servers on Amazon EC2 instances, or migrating all the MySQL database data to Amazon S3 are not the best options to meet the requirements. These options would not automate the tasks of patching the database and taking backup snapshots, and would require more operational overhead from the company3

NEW QUESTION # 312
A company wants to query its server logs to gain insights about its customers' experiences.
Which AWS service will store this data MOST cost-effectively?

- A. Amazon S3
- B. Amazon Elastic Block Store (Amazon EBS)
- C. Amazon Aurora
- D. Amazon Elastic File System (Amazon EFS)

Answer: A

Explanation:
Explanation
Amazon S3 is an AWS service that provides scalable, durable, and cost-effective object storage in the cloud.
Amazon S3 can store any amount and type of data, such as server logs, and offers various storage classes with different performance and pricing characteristics. Amazon S3 is the most cost-effective option for storing server logs, as it offers low-cost

storage classes, such as S3 Standard-Infrequent Access (S3 Standard-IA) and S3 Intelligent-Tiering, that are suitable for infrequently accessed or changing access patterns data. Amazon S3 also integrates with other AWS services, such as Amazon Athena and Amazon OpenSearch Service, that can query the server logs directly from S3 without requiring any additional data loading or transformation.
