# Immersive Learning Experience with Online EXIN CDCP Practice Test Engine

All we want you to know is that people are at the heart of our manufacturing philosophy, for that reason, we place our priority on intuitive functionality that makes our EPI Data Centre exam question to be more advanced. Our CDCP exam prep is capable of making you test history and review performance, and then you can find your obstacles and overcome them. In addition, once you have used this type of CDCP Exam Question online for one time, next time you can practice in an offline environment.

## EXIN CDCP Exam Syllabus Topics:

| Topic | Details |
|---|---|
| Topic 1 | • Electro Magnetic Fields: The topic deals with effects of EMF on human health and equipment (H)EMP, standards, and EMF shielding solutions. |
| Topic 2 | • Power Infrastructure: It focuses ATS and STS systems, redundancy levels and techniques, static and dynamic UPS systems, battery types, thermo-graphics, and renewable energy factor (REF). |
| Topic 3 | • Data Centre Location, Building and Construction: It focuses on appropriate sites and components of an effective data centre and supporting facilities setup. |
| Topic 4 | • Water Supply: This topic is all about water supply techniques and application areas. |
| Topic 5 | • Physical Security and Safety: Sub-topics are about physical security considerations and physical safety considerations. |
| Topic 6 | • Light: This topic covers light fixture types and placement, emergency lighting, and emergency Power Supply (EPS). |
| Topic 7 | • Equipment Racks: It discusses power rail<br>• strip options, security considerations, and rack standards, properties and selection criteria. |
| Topic 8 | • Fire Safety<br>• Protection: This topic gives an understanding of standards for fire suppression, detection systems, total flooding fire suppression techniques, and handheld extinguishers. Additionally, it covers Signage and safety. |

| Topic 9 | • Raised Floor<br>• Suspended Ceiling: The topic discusses applicable standards, signal reference grid, and disability act and regulations. |
|---|---|
| Topic 10 | • Auxiliary Systems: The topic covers water leak detection systems, data centre monitoring requirements, EMS, BMS and DCIM. |

# Latest Updated Downloadable CDCP PDF | Newest Study CDCP Plan: Certified Data Centre Professional (CDCP)

Probably many people have told you how difficult the CDCP exam is; however, our Free4Torrent just want to tell you how easy to pass CDCP exam. Our strong IT team can provide you the CDCP exam software which is absolutely make you satisfied; what you do is only to download our free demo of CDCP t have a try, and you can rest assured t purchase it. We can be along with you in the development of IT industry. Give you a helping hand.

# EXIN Certified Data Centre Professional (CDCP) Sample Questions (Q38-Q43):

**NEW QUESTION # 38**
Which Class of Fires involves ordinary combustible materials such as paper, wood and cloth?

- A. Class D
- B. Class A
- C. Class K
- D. Class B

**Answer: B**

Explanation:
According to the CDCP Preparation Guide, Class A fires involve ordinary combustible materials such as paper, wood and cloth. These materials leave behind ash or embers when they burn. Class A fires can be extinguished by water or other cooling agents that reduce the temperature of the fuel below its ignition point.

**NEW QUESTION # 39**
Which type of Humidifier is composed of water-filled canister containing electrodes?

- A. Infrared Humidifiers
- B. Water Canister Humidifier
- C. Ultrasonic Humidifier
- D. Steam Canister Humidifier

**Answer: D**

Explanation:
A steam canister humidifier is a type of humidifier that uses electricity to heat water in a canister containing electrodes. The water conductivity and the water level determine the amount of current and steam production.
The steam canister humidifier is also known as an electrode boiler humidifier or an electrode steam humidifier123.

# NEW QUESTION # 40

What is the primary reason to install a monitoring system in the data centre?

- A. To be able to collect data for capacity planning
- B. To notice abnormalities early so that actions can be taken to avoid disasters
- C. To implement automated change management
- D. To create a proper asset database

**Answer: B**

Explanation:

The primary reason to install a monitoring system in the data centre is to notice abnormalities early so that actions can be taken to avoid disasters, according to the CDCP Preparation Guide1 and various web sources234. A monitoring system is a system that collects and analyzes data about the power, cooling, environmental, and security conditions in the data centre, and alerts the operators or managers about any issues or threats that may affect the performance, availability, or reliability of the data centre. A monitoring system can help to prevent or minimize the impact of disasters, such as power outages, fire, water damage, overheating, equipment failure, or cyberattacks, by providing timely and accurate information that enables fast and corrective action. A monitoring system can also help to improve the energy efficiency, capacity planning, and asset management of the data centre, by providing useful insights and trends that support informed decision making.

# NEW QUESTION # 41

When dealing with glass door racks, cool air is injected into the rack from:

- A. The top of the rack through the fans and vents mounted inside the rack.
- B. The rear door in a downflow direction.
- C. The front door in a downflow direction.
- D. The bottom of the rack.

**Answer: B**

Explanation:

Glass door racks are a type of rack that have solid glass front doors and rear door heat exchangers (RDHx).
RDHx are devices that use facility coolant to absorb heat from the exhaust air of the IT equipment and return cool air to the room.
RDHx can be either passive or active, depending on the fan configuration. In general, IT hardware within the rack is air-cooled and the door heat exchanger uses facility coolant to absorb heat from exhaust air to return air to the facility at or near inlet air temperature to the rack. This rear door heat exchanger can either be a passive or active solution. When dealing with glass door racks, cool air is injected into the rack from the rear door in a downflow direction. This means that the cool air flows from the top to the bottom of the rack, following the natural convection of the hot air rising. This way, the cool air can reach all the IT equipment in the rack and prevent hot spots or overheating.

# NEW QUESTION # 42

What are the four main components of a refrigeration circuit?

- A. Evaporator, compressor, condenser, expansion valve
- B. Condenser, expansion valve, buffer tank, de-icing unit
- C. Evaporation, membrane filter, monitor sensor, pressure valve
- D. Thermostat, monitoring interface, indoor unit, outdoor unit

**Answer: A**

Explanation:

The four main components of a refrigeration circuit are the evaporator, the compressor, the condenser, and the expansion valve, according to the CDCP Preparation Guide1 and various web sources234. A refrigeration circuit is a system that transfers heat from

a low-temperature region to a high-temperature region, using a working fluid called refrigerant. The refrigeration circuit operates in a closed loop, where the refrigerant changes its state from liquid to vapor and back to liquid, while absorbing and releasing heat. The four main components of the refrigeration circuit perform the following functions:

*The evaporator is a heat exchanger that absorbs heat from the low-temperature region, such as the data centre room, and transfers it to the refrigerant. The refrigerant enters the evaporator as a low-pressure, low-temperature liquid, and leaves the evaporator as a low-pressure, low-temperature vapor.

*The compressor is a mechanical device that increases the pressure and temperature of the refrigerant vapor.

The refrigerant enters the compressor as a low-pressure, low-temperature vapor, and leaves the compressor as a high-pressure, high-temperature vapor.

*The condenser is another heat exchanger that releases heat from the refrigerant to the high-temperature region, such as the outside air or water. The refrigerant enters the condenser as a high-pressure, high-temperature vapor, and leaves the condenser as a high-pressure, low-temperature liquid.

*The expansion valve is a device that reduces the pressure and temperature of the refrigerant liquid. The refrigerant enters the expansion valve as a high-pressure, low-temperature liquid, and leaves the expansion valve as a low-pressure, low-temperature liquid. The expansion valve also controls the flow of the refrigerant into the evaporator, depending on the cooling load.
