Data-Architect Interactive EBook & New Data-Architect Test Voucher

Our Data-Architect learning guide boosts many advantages and it is your best choice to prepare for the test. Firstly, our Data-Architect training prep is compiled by our first-rate expert team and linked closely with the real exam. So that if you practice with our Data-Architect Exam Questions, then you will pass for sure. Secondly, our Data-Architect study materials provide 3 versions and multiple functions to make the learners have no learning obstacles. They are the PDF, Software and APP online.

Salesforce Certified Data Architect Sample Questions (Q45-Q50):

NEW QUESTION # 45
Universal Containers is looking to use Salesforce to manage their sales organization. They will be migrating legacy account data from two aging systems into Salesforce. Which two design considerations should an architect take to minimize data duplication? Choose 2 answers

- A. Use Salesforce matching and duplicate rules.
- B. Import the data concurrently.
- C. Clean data before importing to Salesforce.
- D. Use a workflow to check and prevent duplicates.

Answer: A,C

NEW QUESTION # 46
UC has multiple SF orgs that are distributed across regional branches. Each branch stores local customer data inside its org's Account and Contact objects. This creates a scenario where UC is unable to view customers across all orgs.
UC has an initiative to create a 360-degree view of the customer, as UC would like to see Account and Contact data from all orgs in one place.
What should a data architect suggest to achieve this 360-degree view of the customer?

- A. Consolidate the data from each org into a centralized datastore
- B. Use an ETL tool to migrate gap Accounts and Contacts into each org.
- C. Use Salesforce Connect's cross-org adapter.
- D. Build a bidirectional integration between all orgs.

Answer: A

NEW QUESTION # 47
Cloud Kicks is launching a Partner Community, which will allow users to register shipment requests that are then processed by Cloud Kicks employees. Shipment requests contain header information, and then a list of no more than 5 items being shipped. First, Cloud Kicks will introduce its community to 6,000 customers in North America, and then to 24,000 customers worldwide within the next two years. Cloud Kicks expects 12 shipment requests per week per customer, on average, and wants customers to be able to view up to three years of shipment requests and use Salesforce reports.
What is the recommended solution for the Cloud Kicks Data Architect to address the requirements?

- A. Create a custom object to track shipment requests and a child custom object to track shipment items. Implement an archiving process that moves data off-platform after three years.
- B. Create an external custom object to track shipment requests with five lookup custom fields for each item being shipped. External objects are stored off-platform in Heroku's Postgres database.
- C. Create a custom object to track shipment requests with five lookup custom fields for each item being shipped Implement an archiving process that moves data off-platform after three years.
- D. Create an external custom object to track shipment requests and a child external object to track shipment items. External objects are stored off-platform in Heroku's Postgres database.

Answer: A

NEW QUESTION # 48
NTO has a loyalty program to reward repeat customers. The following conditions exists:
1.Reward levels are earned based on the amount spent during the previous 12 months.
2.The program will track every item a customer has bought and grant them points for discount.
3.The program generates 100 million records each month.

NTO customer support would like to see a summary of a customer's recent transaction and reward level(s) they have attained. Which solution should the data architect use to provide the information within the salesforce for the customer support agents?

- A. Capture the reward program data in an external data store and present the 12 months trailing summary in salesforce using salesforce connect and then external object.
- B. Create a custom object in salesforce to capture and store all reward program. Populate nightly from the point-of-scale system, and present on the customer record.
- C. Create a custom big object to capture the reward program data and display it on the contact record and update nightly from the point-of-scale system.
- D. Provide a button so that the agent can quickly open the point of sales system displaying the customer history.

Answer: C

Explanation:
According to the Get Started with Big Objects unit on Trailhead, one of the use cases for custom big objects is to store and manage loyalty program data for customers. The unit states that "From loyalty programs to transactions, order, and billing information, use a custom big object to keep track of every detail." Therefore, a custom big object can be used to capture the reward program data and display it on the contact record.
Additionally, according to the Big Objects Implementation Guide, big objects can handle massive amounts of data (up to billions of records) and can be updated nightly from external systems using Bulk API or batch Apex. Therefore, a custom big object can meet the requirements of NTO's loyalty program scenario.

NEW QUESTION # 49
Universal Containers (UC) management has identified a total of ten text fields on the Contact object as important to capture any changes made to these fields, such as who made the change, when they made the change, what is the old value, and what is the new value. UC needs to be able to report on these field data changes within Salesforce for the past 3 months. What are two approaches that will meet this requirement?
Choose 2 answers

- A. Turn on field Contact object history tracking for these ten fields, then create reports on contact history.
- B. Write an Apex trigger on Contact after insert event and after update events and store the old values in another custom object.
- C. Create a Contact report including these ten fields and Salesforce Id, then schedule the report to run once a day and send email to the admin.
- D. Create a workflow to evaluate the rule when a record is created and use field update actions to store previous values for these ten fields in ten new fields.

Answer: A,B

Explanation:
To capture and report on any changes made to ten text fields on the Contact object for the past 3 months, the data architect should write an Apex trigger on Contact after insert and after update events and store the old values in another custom object, or turn on field Contact object history tracking for these ten fields and create reports on contact history. An Apex trigger can capture the old and new values of the fields, as well as the user and time of the change, and store them in a custom object that can be used for reporting. Field history tracking can also track the changes to the fields and store them in a history table that can be used for reporting.
However, field history tracking only retains data for up to 18 months or 24 months with an extension, so it may not be suitable for longer-term reporting needs. The other options are not feasible or effective for capturing and reporting on field data changes.

NEW QUESTION # 50
......

This is the Data-Architect PDF format which contains real Data-Architect exam questions. You can print it and make a hard copy of this PDF file as well which helps you to prepare on the go. It comes in handy format and helps you prepare well with updated Salesforce Certified Data Architect exam questions. Moreover, this PDF has questions that are according to the present content of the test. This PDF format helps you to enhance your understanding of each topic which you need to self-evaluate to boost your Salesforce Data-Architect Exam Score.
