Appian Certified Analyst Sample Questions (Q15-Q20):

NEW QUESTION # 15

Of the choices provided, which are the three most appropriate use cases for Appian?

- A. The customer needs to have one site tab for each of their seven personas
- B. The customer needs to be able to run their application on mobile devices
- C. The customer needs to perform large-scale extract, transform, and load (ETL) operations
- D. The customer needs to be able to embed the application within their own web page
- E. The customer needs to be able to run their application in a browser

Answer: A,B,E

Explanation:

Appian is a low-code platform designed for building enterprise applications with a focus on flexibility, user experience, and integration capabilities. The most appropriate use cases for Appian include:

Mobile Compatibility (B):

Appian supports mobile-first design, allowing applications to be easily accessed and used on mobile devices without requiring separate development efforts.

This capability is critical for businesses that need their workforce to access applications on the go.

Multiple Site Tabs for Personas (C):

Appian allows for the creation of different site tabs for different user personas, each with a tailored user experience.

This is ideal for organizations with distinct user groups who need customized interfaces and access to specific parts of the application.

Browser-Based Application (D):

Appian applications are web-based and can be accessed directly from a browser, ensuring easy access and a consistent user experience across different platforms.

Why Not Other Options?:

A . Large-Scale ETL Operations: Appian is not primarily designed for heavy data extraction, transformation, and loading (ETL) tasks, which are typically handled by specialized ETL tools.

E . Embedding in Web Pages: While Appian allows for embedding certain components, it is not the primary focus or strength of the platform compared to full-featured applications.

NEW QUESTION # 16

Which three use cases are best suited for implementation with Appian?

- A. A use case that requires integrations with different systems
- B. A use case that requires reporting and displaying graphs
- C. A use case that requires multiple approval workflows
- D. A use case that requires the editing of documents without third-party integration
- E. A use case that can be developed and run offline only

Answer: A,B,C

Explanation:

A use case that requires integrations with different systems (A): Appian is designed to integrate seamlessly with various external systems, making it suitable for use cases that involve data exchange or communication between multiple systems. This capability allows for the creation of comprehensive and connected business processes within a single platform. Appian Integration Capabilities

A use case that requires multiple approval workflows (C): Appian excels in automating and managing complex business workflows, including those that require multiple layers of approval. Its workflow engine supports the orchestration of tasks, ensuring that the right people are involved in the process at the right time. Appian Workflow Automation

A use case that requires reporting and displaying graphs (E): Appian provides robust reporting and analytics capabilities, allowing users to create detailed reports and visualizations. This makes it an ideal choice for use cases where data needs to be reported and visualized effectively. Appian Reporting and Analytics

NEW QUESTION # 17

Improvements are being considered for an Expense Process, and you have been asked to capture that there is now an approval task sent to the finance manager.

As part of the approval, the process should also reflect that if the payment has not been authorized within 48 hours, a reminder message is sent to the finance manager to inform them they have an outstanding task.

Which Business Process Model and Notation (BPMN) notation type would you use to illustrate the reminder message?

- A. Intermediate event
- B. Start event
- C. Gateway
- D. Data object

Answer: A

Explanation:

In BPMN, an intermediate event is used to indicate events that occur between the start and end of a process. To model a reminder message that is sent if the payment is not authorized within 48 hours, an intermediate event, specifically a timer intermediate event, is the appropriate notation.

Intermediate Event Overview:

An intermediate event can be used to model actions such as delays, triggers, or messages that happen during the course of a process.

A timer intermediate event would be used to trigger the reminder after a set period (in this case, 48 hours).

Why Not Other Options?:

A . Data Object: Represents data stored or used by the process, not an event or action.

B . Gateway: Used for decision points or branching paths, not for triggering events.

D . Start Event: Marks the beginning of a process and cannot be used mid-process.

Using an intermediate event ensures that the process can trigger the reminder at the right time, enhancing process automation and efficiency.

NEW QUESTION # 18

What is the primary benefit of using Appian's Record Type feature?

- A. It enables the integration of third-party APIs.
- **B. It facilitates the display of external data in an integrated manner.**
- C. It automates user interface design.
- D. It allows for the creation of static forms.

Answer: B

NEW QUESTION # 19

Which Appian object's primary purpose is to define the structure of related data for use in a process model?

- A. Expression Rule
- B. Record
- C. Constant
- **D. Custom Data Type (CDT)**

Answer: D

Explanation:

A Custom Data Type (CDT) in Appian is primarily used to define the structure of related data. It represents a structured data type composed of multiple fields, and it is often used in process models to define the shape of data that will be passed between different activities or stored in the database.

Custom Data Type (CDT) Overview:

CDTs allow developers to define a complex data structure that can include various data types, such as text, numbers, dates, and even nested CDTs.

They are essential for passing structured data within a process model and between Appian applications and external systems.

Why Not Other Options?:

B . Record: Used to represent a view of data from an external or internal source, focusing on displaying and interacting with that data rather than defining its structure.

C . Constant: Stores a fixed value that can be used throughout the application, but it does not define complex data structures.

D . Expression Rule: Encapsulates logic and calculations but does not define data structures.

Appian Documentation on Custom Data Types: Custom Data Types (CDT)

Using CDTs ensures that the data used within process models is structured and consistent, enabling robust data handling across the application.
