Study InsuranceSuite-Analyst Reference | Pdf InsuranceSuite-Analyst Exam Dump

High quality and high accuracy InsuranceSuite-Analyst real materials like ours can give you confidence and reliable backup to get the certificate smoothly because our experts have extracted the most frequent-tested points for your reference, because they are proficient in this exam who are dedicated in this area over ten years. Besides, from economic perspective, our InsuranceSuite-Analyst study dumps are priced reasonably so we made a balance between delivering satisfaction to customers and doing our own jobs. So in this critical moment, our InsuranceSuite-Analyst real materials will make you satisfied. Our InsuranceSuite-Analyst exam materials can provide integrated functions. You can learn a great deal of knowledge and get the certificate of the exam at one order like win-win outcome at one try.

Guidewire Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Sample Questions (Q43-Q48):

NEW QUESTION # 43

The goal of an elaboration workshop is to identify value-driven changes to the OOTB User Story that supports business processes. Who are the key stakeholders in this process?

- A. Subject Matter Expert
- B. Development resources
- C. Scrum Master
- D. Business Analyst

Answer: A,D

Explanation:

Elaboration Workshops (typically occurring during the Inception phase) are the primary venue for defining and refining requirements. The goal is to take the "Out-of-the-Box" (OOTB) user stories and determine if they meet business needs or if changes are required to deliver specific business value.

The Key Stakeholders required to drive this specific process are:

* Subject Matter Experts (SMEs) (D): They are the "Voice of the Customer." They possess the deep business knowledge required to explain the current and desired processes. They are the ones who determine if a feature has value and define the acceptance criteria. Without them, the "value-driven" aspect of the workshop cannot be achieved.

* Business Analysts (BAs) (A): They facilitate the workshop. Their role is to elicit the information from the SMEs, challenge assumptions to ensure simplicity (sticking to OOTB where possible), and document the requirements into clear User Stories. They act as the bridge between the business need and the technical solution.

Why the others are not "Key Stakeholders" for identifying value :

* Development resources (C): While developers (or Architects) often attend these workshops (part of the "Three Amigos" concept) to provide technical feasibility assessments and cost estimates, they do not define the business value . They define the solution .

* Scrum Master (B): The Scrum Master ensures the Agile process is followed and removes impediments but does not contribute to the content of the requirements or the definition of business value.

NEW QUESTION # 44

Gosu rules are:

- A. Configured by Analysts after they are documented in the User Story Cards
- B. Created and maintained by developers

- C. Managed in Business Rules UI screens
- D. Capable of handling complex logic

Answer: B,D

Explanation:

Comprehensive and Detailed Explanation:

In the Guidewire architecture, application logic is primarily divided into two categories: Gosu Rules (often just called "Rules" or "Rule Sets") and Business Rules (or "App Rules").

* Created and Maintained by Developers (Option B):

Gosu Rules are written in the Gosu programming language and are managed within the Guidewire Studio development environment. Because Studio is a technical tool used for coding and configuration, Gosu rules are exclusively the domain of the Developer. Analysts do not have access to configure these directly; instead, they document the logic requirements in User Stories for developers to implement.

* Capable of Handling Complex Logic (Option C):

Because Gosu is a full-featured object-oriented programming language (similar to Java), Gosu Rules are used for implementing complex logic that requires sophisticated data manipulation, integration calls, or advanced calculations.

Why the other options are incorrect:

* A. Managed in Business Rules UI screens: This describes Business Rules (not Gosu Rules). The Business Rules Framework allows authorized non-developers (like Analysts or Business Users) to manage logic through the application's User Interface. These are typically simpler, parameter-driven rules (e.g., "If State is CA, Assign to Group A").

* D. Configured by Analysts: Analysts define the requirements for Gosu rules, but they do not configure them. Analysts only configure Business Rules in the UI.

NEW QUESTION # 45

From the answers below, select the option that best describes Guidewire Accelerators.

- A. Are available on <https://education.guidewire.com>
- B. Are always complete solutions ready and available for use on your project
- C. Provide an extension to a core product to meet a specific need
- D. Are specific user stories developed early in the project to accelerate task completion

Answer: C

Explanation:

Guidewire Accelerators are reusable assets designed to speed up implementation activities and reduce effort by leveraging proven approaches. Among the available options, Option D best describes their purpose.

Accelerators typically provide extensions, utilities, templates, or tools that complement core Guidewire products to address common implementation needs. They are not full, ready-made solutions but instead help teams avoid reinventing common components or approaches.

Accelerators are often accessed via the Guidewire Marketplace and may include configuration helpers, integration utilities, migration tools, or reference implementations. Their goal is to improve efficiency while remaining aligned with Guidewire standards and upgradeability principles.

The other options are incorrect. Accelerators are not always complete solutions (Option A), are not individual user stories (Option B), and are not hosted on the education portal (Option C).

By understanding what Accelerators are—and what they are not—analysts can better evaluate when to leverage them to reduce risk, cost, and delivery timelines in Guidewire projects.

NEW QUESTION # 46

A Business Analyst (BA) is reviewing a user story and its acceptance criteria before development begins.

The acceptance criteria state, "The system should correctly process the claim transaction after the external payment gateway confirms the payment." Applying the INVEST principles for good user stories, which two principles are MOST directly relevant to the BA's concerns about this user story?

- A. Negotiable
- B. Estimable
- C. Testable
- D. Valuable
- E. Small

- F. Independent

Answer: B,C

Explanation:

Comprehensive and Detailed Explanation:

The INVEST model (Independent, Negotiable, Valuable, Estimable, Small, Testable) is used to assess the quality of user stories. In the specific example provided, the phrase "correctly process" creates significant ambiguity, which primarily impacts two principles:

* Testable (F): A good user story must have acceptance criteria that provide a clear "Pass/Fail" result.

The word "correctly" is subjective and ambiguous. A Quality Analyst cannot write a specific test script or automated Gherkin scenario based on "correctly." They need to know the specific expected behaviors (e.g., "The Claim Status changes to 'Paid'" or "A Payment Activity is generated"). Without these specifics, the story is not testable.

* Estimable (D): For a developer to provide an accurate story point estimate (sizing), they must understand the scope of the work.

The vague phrase "correctly process" hides the underlying complexity. Does "processing" involve just updating a status field (1 point), or does it involve generating a General Ledger transaction, sending a confirmation email, and creating a document (5 points)? Because the scope is undefined, the story is not estimable.

Why other options are less relevant:

* A. Independent: While the story mentions an "external payment gateway," which implies a system dependency, the primary drafting flaw highlighted in the question is the vagueness of the acceptance criteria. Independence usually refers to dependencies between other user stories in the backlog.

* E. Small: There is not enough information to judge the size of the story, but the ambiguity makes it impossible to size (Estimable) rather than explicitly "Too Big."

NEW QUESTION # 47

Which of the following are primary ways a Quality Analyst contributes to the requirements elaboration process in a Guidewire Cloud project, according to the training?

- A. To analyze the existing system logic to identify potential impacts of new requirements
- B. To identify potential personal biases that could influence requirements or suggested solutions
- C. To ensure the requirements are defined with sufficient detail and clarity to be testable, including acceptance criteria
- D. To facilitate discussions between business stakeholders and developers to resolve requirement ambiguities
- E. To estimate the level of effort required for developing the user interface changes based on the requirements
- F. To collaborate on defining acceptance criteria using structured formats like Given-When-Then

Answer: C,F

Explanation:

In a Guidewire Cloud project, particularly one utilizing SurePath and Behavior-Driven Development (BDD), the Quality Analyst (QA) plays a proactive "Shift Left" role during the requirements elaboration phase.

* Ensuring Testability (Option B): The QA's primary lens during elaboration is "How will I test this?" They review requirements to ensure they are unambiguous, complete, and measurable. If a requirement is vague (e.g., "The system should be fast"), the QA challenges it to ensure specific acceptance criteria are defined (e.g., "The page loads in under 2 seconds").

* Collaborating on Gherkin (Option F): Guidewire methodology heavily promotes BDD. The QA collaborates with the Business Analyst and Developer (the "Three Amigos") to translate business rules into structured Given-When-Then scenarios. These scenarios serve as both the requirements documentation and the executable test scripts.

Why other options are less appropriate:

* A. Facilitate discussions: While QAs participate, Business Analysts or Scrum Masters typically facilitate the sessions.

* C. Estimate UI effort: This is the responsibility of the Developers. QAs estimate the testing effort.

* D. Analyze system logic: While QAs assess regression impact, the deep analysis of existing code/system logic is primarily a Developer or Architect task.

* E. Identify personal biases: While critical thinking is important, it is not listed as a "primary way" of contribution compared to the concrete deliverables of Acceptance Criteria and BDD scenarios.

NEW QUESTION # 48

.....

Improvement in InsuranceSuite-Analyst science and technology creates unassailable power in the future construction and progress of society. As we can see, the rapid progression of the whole world is pushing people forward and the competitiveness among people who are fighting on the first line is growing intensely. Numerous advantages of InsuranceSuite-Analyst training materials are well-

recognized, such as 99% pass rate in the exam, free trial before purchasing, secure privacy protection and so forth. From the customers' point of view, our InsuranceSuite-Analyst Test Question put all candidates' demands as the top priority. We treasure every customer' reliance and feedback to the optimal InsuranceSuite-Analyst practice test.
