## GIAC Global Industrial Cyber Security Professional (GICSP) Sample Questions (Q33-Q38):

### NEW QUESTION # 33

In the context of ICS the process of fuzzing a device is described as which of the following?

- A. Brute force password attacks against default accounts
- B. Launching all known exploits at the device in a randomized sequence
- C. Monitoring device performance in varying power conditions
- D. Providing invalid, unexpected, or random data as inputs
- E. Monitoring device performance in harsh environmental conditions

**Answer: D**

Explanation:

Fuzzing (C) is a security testing technique that involves sending invalid, unexpected, or random inputs to a device or application to discover vulnerabilities like buffer overflows or crashes.

Brute force attacks (A) target authentication, not input validation.

Launching known exploits (B) is penetration testing but not fuzzing.

(D) and (E) describe environmental or stress testing.

GICSP highlights fuzzing as a proactive testing method to uncover ICS device vulnerabilities.

**NEW QUESTION # 34**

Which type of process is described below?

A fermentor's glycol jacket must maintain a steady temperature during and between batches of beer.

- A. Continuous
- **B. Batch**
- C. Discrete
- D. Manual

**Answer: B**

Explanation:

The process described involves maintaining a consistent condition during and between batches of production, characteristic of a batch process.

Batch processes are executed in defined quantities or lots where the process starts, runs for a set time, and then stops or resets for the next batch. The fermentor's glycol jacket temperature must be carefully controlled throughout the batch to ensure product quality. Continuous processes (A) run nonstop with steady-state conditions, typical in chemical refineries but not in batch fermentation.

Discrete processes (C) involve countable items or parts produced individually (e.g., manufacturing of assembled products).

Manual (B) refers to human-driven control rather than an automated process type.

Batch processing is common in brewing and food industries and is covered in GICSP's ICS Fundamentals and Operations domain, which differentiates process types to tailor cybersecurity strategies for control systems.

**NEW QUESTION # 35**

Which type of process is used to manufacture fuels, chemicals, and plastics?

- **A. Continuous**
- B. Discrete
- C. Batch

**Answer: A**

Explanation:

The manufacturing of fuels, chemicals, and plastics typically involves continuous processes (C), where raw materials flow continuously through reactors, mixers, or other equipment to produce the final product without interruption.

Discrete processes (A) deal with countable units like assembled products.

Batch processes (B) are run in defined lots or batches, common in pharmaceuticals or food production but not typical for fuels and chemicals.

GICSP emphasizes the need to understand process types to implement appropriate control and cybersecurity measures.

**NEW QUESTION # 36**

What is a recommended practice for securing historians and databases whose purpose is to feed data back into the control processes?

- A. Use a dedicated domain admin user account to manage databases
- B. Use reliable network protocols like HTTP for remote management

- C. Facilitate auditing by placing historians and databases in the same DMZ
- D. Audit both successful and failed login attempts to databases

**Answer: D**

Explanation:

For systems such as historians and databases critical to control processes, it is important to maintain comprehensive security monitoring, including:

Auditing both successful and failed login attempts (A) to detect unauthorized access attempts and provide accountability.

Placing systems in the same DMZ (B) may increase exposure; segmentation is usually preferred.

Using domain admin accounts (C) increases risk by providing excessive privileges; least privilege is recommended.

HTTP (D) is not recommended for management due to lack of encryption; secure protocols like HTTPS or SSH should be used.

GICSP emphasizes rigorous auditing and monitoring as essential for detecting and preventing insider threats and unauthorized access to critical ICS data.

**NEW QUESTION # 37**

According to the DHS suggested patch decision tree, what should the next step be if there is a vulnerability with an available patch, but without an available workaround?

- A. Test and apply the patch
- B. Determine if the operational needs are greater than the risk
- C. Identify the vulnerability and the available patch
- D. Determine if the vulnerability affects the ICS

**Answer: A**

Explanation:

The DHS (Department of Homeland Security) patch decision tree provides a systematic approach for patch management in ICS environments, balancing security and operational availability.

When a vulnerability is identified and a patch is available, but no workaround exists, the recommended next step is to test and apply the patch (C). This ensures that the system is protected as quickly as possible while verifying that the patch does not disrupt critical ICS operations.

(A) Identifying if the vulnerability affects the ICS typically comes earlier in the decision tree.

(B) Evaluating operational needs versus risk is part of risk management but comes after confirming patch availability.

(D) Identifying the vulnerability and patch is a prerequisite step.

This approach aligns with GICSP's emphasis on structured patch management and testing before deployment in critical environments.
