질문 # 44

(A company is developing an application with the following requirements: * Amazon EC2 instances must be restricted to Free Tier-eligible types. * Instances of unapproved types must be terminated automatically.

Which two services should be used? Choose 2 answers.)

- A. Systems Manager
- B. OpsWorks
- C. Config
- D. Launch Wizard

정답: A,C

설명:

To meet the requirements of restricting EC2 instances to Free Tier-eligible types and automatically terminating unapproved instances, AWS Systems Manager and AWS Config should be used. Systems Manager can enforce instance compliance through automation documents that monitor and terminate non-compliant instances. AWS Config provides continuous monitoring and evaluation of resource configurations against defined rules, such as those limiting instance types to Free Tier-eligible options (e.g., t2.micro or t3.micro). The WGU Cloud Deployment and Operations Study Guide (Section 6.1, AWS Config and Systems Manager) notes, "AWS Config can be configured with a rule to detect non-Free Tier EC2 instances, while Systems Manager Automation can execute a termination script based on Config findings." OpsWorks and Launch Wizard are not designed for this specific compliance and automation use case.

질문 # 45

(An administrator plans to deploy a database to AWS that supports the following: multiple Availability Zones, a standby database instance that provides failover support, a database instance that allows only read-only connections. Which two database solutions should the administrator use? Choose 2 answers.)

- A. Amazon RDS Multi-AZ DB instance
- B. Amazon Aurora DB cluster with multi-master replication
- C. Amazon Aurora DB instance with Aurora Replica
- D. Amazon RDS Multi-AZ DB cluster

정답: A,C

설명:

To meet the requirements, the administrator should use an Amazon RDS Multi-AZ DB instance for multiple Availability Zones and failover support, and an Amazon Aurora DB instance with Aurora Replica for a read-only connection. The RDS Multi-AZ configuration automatically provisions a standby instance in a different AZ for failover, while Aurora Replicas provide read-only instances for scaling read traffic. The WGU Cloud Deployment and Operations Study Guide (Section 7.1, RDS and Aurora) states, "RDS Multi-AZ deploys a standby instance across AZs for failover, and Aurora Replicas are read-only instances that enhance performance by offloading read traffic from the primary instance." Options A and D are incorrect as multi-master replication and Multi-AZ clusters do not align with the read-only requirement.

질문 # 46

(Which two locations can Amazon Inspector publish its findings in when it has detected an anomaly? Choose 2 answers.)

- A. SNS
- B. CloudTrail
- C. CloudWatch
- D. SQS

정답: A,C

설명:

Amazon Inspector can publish its findings when detecting anomalies to Amazon SNS for real-time notifications and to CloudWatch for metric and event logging, enabling monitoring and response. The WGU Cloud Deployment and Operations Study Guide (Section 6.2, Amazon Inspector) states, "Inspector findings are published to SNS for immediate alerts and to CloudWatch for detailed logging, allowing integration with other AWS services for anomaly response." CloudTrail logs API calls, and SQS is a messaging queue, neither of which are primary destinations for Inspector findings.

질문 # 47

(Which two solutions are supported by CloudWatch? Choose 2 answers.)

- A. Instance monitoring
- B. Event response
- C. Threat detection
- D. Load balancing

정답: A,B

설명:

Amazon CloudWatch supports several monitoring and management solutions, including event response and instance monitoring. Event response is facilitated through CloudWatch Events, which can trigger actions based on predefined rules, such as invoking AWS Lambda functions. Instance monitoring involves collecting and tracking metrics from Amazon EC2 instances, providing visibility into performance and health. The WGU Cloud Deployment and Operations Study Guide (Section 4.1, CloudWatch Overview) highlights that CloudWatch is designed for instance monitoring and event-driven responses, while load balancing and threat detection are handled by services like Elastic Load Balancing and GuardDuty, respectively.

질문 # 48

(A company is using Route 53 for Domain Name System (DNS) hosting. The company requires a zone that should only be accessible from instances in a Virtual Private Cloud (VPC). Which type of hosted zone should be used?)

- A. Lightsail DNS Zone
- B. DNS Zone
- C. Public Hosted Zone
- D. Private Zone

정답: D

설명:

A Private Hosted Zone in Amazon Route 53 should be used to restrict DNS resolution to instances within a Virtual Private Cloud (VPC), ensuring that the zone is only accessible internally. This isolates DNS services from public internet access. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53 Hosted Zones) states, "A Private Hosted Zone in Route 53 limits DNS resolution to resources within a specified VPC, preventing external access and enhancing security for internal services." Public Hosted Zones, DNS Zones, and Lightsail DNS Zones do not provide this VPC-specific restriction.
