□

An architect must design a solution that uses the direct link between R1 and R2 for traffic from 10.10.10.0/24 toward network 10.10.20.0/24. Which solution should the architect include in the design?

- A. Configure the OSPF cost of the link to a value lower than 30.
- B. Lower the Administrative Distance for OSPF area 0.
- C. Place the link into area 2 and install a new link between R1 and R2 in area 0.
- D. Configure the link to provide multiarea adjacency.

Answer: A

NEW QUESTION # 257

Refer to the exhibit.

□

EIGRP has been configured on all links. The spoke nodes have been configured as EIGRP stubs, and the WAN links to R3 have higher bandwidth and lower delay than the links to R4. When a link failure occurs at the R1-R2 link, what happens to traffic on R1 that is destined for a subnet attached to R2?

- A. R1 forwards the traffic to R3 in order to reach R2
- B. R1 has no route to R2 and drops the traffic
- C. R1 forwards the traffic to R3, but R3 drops the traffic
- D. R1 load-balances across the paths through R3 and R4 to reach R2

Answer: B

Explanation:

The EIGRP stub routing feature will prevent the remote device from advertising core routes back to the distribution devices. Routes
