In the PDF version, real Professional-Cloud-Developer exam questions are available. These Google Professional-Cloud-Developer

real questions are printable and portable. You can take this PDF document anywhere and study for the Google Certified Professional - Cloud Developer (Professional-Cloud-Developer) exam without time restrictions. PracticeTorrent regularly make changes in the Professional-Cloud-Developer PDF format when required. Professional-Cloud-Developer questions in this format are relevant to the actual test.

Google Professional-Cloud-Developer certification exam is designed for cloud developers who want to demonstrate their proficiency in designing, building, and deploying scalable cloud solutions on the Google Cloud Platform. Professional-Cloud-Developer Exam is a part of the Google Cloud Certification program and is designed to validate the skills and knowledge of cloud developers.

Google Certified Professional - Cloud Developer Sample Questions (Q286-Q291):

NEW QUESTION # 286

You are building a new API. You want to minimize the cost of storing and reduce the latency of serving images. Which architecture should you use?

- A. Transfer Appliance backed by Cloud Filestore
- B. Cloud Content Delivery Network (CDN) backed by Cloud Storage
- C. Compute Engine backed by Persistent Disk
- D. App Engine backed by Cloud Storage

Answer: C

NEW QUESTION # 287

Your teammate has asked you to review the code below. Its purpose is to efficiently add a large number of small rows to a BigQuery table.

Which improvement should you suggest your teammate make?

- A. Include multiple rows with each request.
- B. Write each row to a Cloud Storage object in parallel, then load into BigQuery.
- C. Perform the inserts in parallel by creating multiple threads.
- D. Write each row to a Cloud Storage object, then load into BigQuery.

Answer: A

Explanation:

NEW QUESTION # 288

Case study

This is a case study. Case studies are not timed separately. You can use as much exam time as you would like to complete each case. However, there may be additional case studies and sections on this exam. You must manage your time to ensure that you are able to complete all questions included on this exam in the time provided.

To answer the questions included in a case study, you will need to reference information that is provided in the case study. Case studies might contain exhibits and other resources that provide more information about the scenario that is described in the case study. Each question is independent of the other questions in this case study.

At the end of this case study, a review screen will appear. This screen allows you to review your answers and to make changes before you move to the next section of the exam. After you begin a new section, you cannot return to this section.

To start the case study

To display the first question in this case study, click the Next button. Use the buttons in the left pane to explore the content of the case study before you answer the questions. Clicking these buttons displays information such as business requirements, existing environment, and problem statements. If the case study has an All Information tab, note that the information displayed is identical to the information displayed on the subsequent tabs. When you are ready to answer a question, click the Question button to return to the question.

Company Overview

HipLocal is a community application designed to facilitate communication between people in close proximity. It is used for event planning and organizing sporting events, and for businesses to connect with their local communities. HipLocal launched recently in a

few neighborhoods in Dallas and is rapidly growing into a global phenomenon. Its unique style of hyper-local community communication and business outreach is in demand around the world.

Executive Statement

We are the number one local community app; it's time to take our local community services global. Our venture capital investors want to see rapid growth and the same great experience for new local and virtual communities that come online, whether their members are 10 or 10000 miles away from each other.

Solution Concept

HipLocal wants to expand their existing service, with updated functionality, in new regions to better serve their global customers. They want to hire and train a new team to support these regions in their time zones. They will need to ensure that the application scales smoothly and provides clear uptime data.

Existing Technical Environment

HipLocal's environment is a mix of on-premises hardware and infrastructure running in Google Cloud Platform.

The HipLocal team understands their application well, but has limited experience in global scale applications.

Their existing technical environment is as follows:

- * Existing APIs run on Compute Engine virtual machine instances hosted in GCP.
- * State is stored in a single instance MySQL database in GCP.
- * Data is exported to an on-premises Teradata/Vertica data warehouse.
- * Data analytics is performed in an on-premises Hadoop environment.
- * The application has no logging.
- * There are basic indicators of uptime; alerts are frequently fired when the APIs are unresponsive.

Business Requirements

HipLocal's investors want to expand their footprint and support the increase in demand they are seeing. Their requirements are:

- * Expand availability of the application to new regions.
- * Increase the number of concurrent users that can be supported.
- * Ensure a consistent experience for users when they travel to different regions.
- * Obtain user activity metrics to better understand how to monetize their product.
- * Ensure compliance with regulations in the new regions (for example, GDPR).
- * Reduce infrastructure management time and cost.
- * Adopt the Google-recommended practices for cloud computing.

Technical Requirements

- * The application and backend must provide usage metrics and monitoring.
- * APIs require strong authentication and authorization.
- * Logging must be increased, and data should be stored in a cloud analytics platform.
- * Move to serverless architecture to facilitate elastic scaling.
- * Provide authorized access to internal apps in a secure manner.

In order for HipLocal to store application state and meet their stated business requirements, which database service should they migrate to?

- A. Cloud Memorystore as a cache
- B. Cloud Datastore
- **C. Cloud Spanner**
- D. Separate Cloud SQL clusters for each region

Answer: C

Explanation:

Explanation/Reference:

NEW QUESTION # 289

A governmental regulation was recently passed that affects your application. For compliance purposes, you are now required to send a duplicate of specific application logs from your application's project to a project that is restricted to the security team. What should you do?

- A. Create a job that copies the System Event logs from the `_Required` log bucket into the security team's log bucket in their project.
- B. Create a job that copies the logs from the `_Required` log bucket into the security team's log bucket in their project.
- **C. Create user-defined log buckets in the security team's project. Configure a Cloud Logging sink to route your application's logs to log buckets in the security team's project.**
- D. Modify the `_Default` log bucket sink rules to reroute the logs into the security team's log bucket.

Answer: C

Explanation:

<https://cloud.google.com/architecture/security-log-analytics>

NEW QUESTION # 290

Your company is planning a global event. You need to configure an event registration portal for the event. You have decided to deploy the registration service by using Cloud Run. Your company's marketing team does not want to advertise the Cloud Run service URL. They want the registration portal to be accessed by using a personalized hostname or path in your custom domain URL pattern, for example, <service>.example.com. How should you configure access to the service while following Google-recommended practices?

- A. Configure Cloud Armor to block traffic on the Cloud Run service URL and allow reroutes from only the custom domain URL pattern.
- B. Create a CNAME record that points to the Cloud Run service URL.
- C. Set up an HAProxy on Compute Engine, and add routing rules for a custom domain to the Cloud Run service URL.
- **D. Add a global external Application Load Balancer in front of the service, and configure a DNS record that points to the load balancer's IP address.**

Answer: D

Explanation:

Using a global external Application Load Balancer allows you to serve your Cloud Run service behind a custom domain with flexible routing and SSL support, following Google-recommended best practices for production workloads.
