Ethical Hacking

Sample Exam V022024

1. Which of these was a famous hacktivism group?
 - A. Fan7a5ma
 - B. The Hackers
 - C. Anonymous
2. What is netcat?
 - A. It is a command line tool used to write and read data on the network. For data transmission, Netcat uses the TCP/IP and UDP network protocols.
 - B. It is a hacking tool for Windows
 - C. It is a hacking tool for Linux
3. What is MITRE ATT&CK?
 - A. It is a widely recognized and used cybersecurity framework developed by the MITRE Corporation. Its purpose is to provide a detailed and structured framework that describes the tactics, techniques and procedures.
 - B. It is a widely recognized and used cybercriminal workflow developed by the NMAP Corporation. Its aim is to provide a detailed frame of reference.
 - C. It is a widely recognized and used cybercriminal workflow developed by the Kali Linux Corporation. Its aim is to provide a detailed frame of reference.
4. What are PETS?
 - A. PETS are a set of tools, methods, practices and approaches designed to safeguard and enhance the privacy and security of personal information in digital environments.
 - B. PETS are standards and practices for breaching computer equipment and stealing information.
 - C. PETS are controlled environments where we can practice hacking. They are machines prepared to be hacked.
5. What is a router?
 - A. It is a network device used to direct and forward data traffic between computer networks.
 - B. It is a device that works as an antivirus on servers.
 - C. It is a network protocol for secure data exchange.

therefore they will be enough for you to pass the exam. We have a professional service team, and the service staffs have professional knowledge for CEHPC Exam Materials, if you have any questions, you can consult us.

CertiProf Ethical Hacking Professional Certification Exam Sample Questions (Q39-Q44):

NEW QUESTION # 39

On which page can we check if our email account has been compromised?

- A. <https://rincondelvago.com/>.
- B. <https://facebook.com/>.
- C. <https://havebeenpwned.com/>.

Answer: C

Explanation:

In the realm of personal and organizational information security, tracking historical data breaches is essential for assessing risk. The website Have I Been Pwned? (HIBP) is a verified, industry-standard tool created by security researcher Troy Hunt that allows individuals and security professionals to check if an email address or username has been part of a publicly known data breach. When a major service (like LinkedIn, Adobe, or MySpace) is compromised, hackers often leak the resulting databases onto the "dark web". HIBP aggregates these leaks into a searchable interface.

For an ethical hacker, HIBP is an invaluable resource during the passive recognition phase of an engagement.

By checking an organization's employee emails against this database, a tester can identify which staff members have had their credentials exposed in the past. This is critical because many users "recycle" passwords across multiple services. If an employee's password was leaked in a breach of a non-work-related site, an attacker might attempt to use those same credentials to gain access to the corporate network—a technique known as "credential stuffing".

Using the site is simple: users enter their email address, and the service returns a list of breaches that included that address, along with what types of data were stolen (e.g., passwords, birthdates, or IP addresses). If a compromise is found, the immediate remediation step is to change the password for that account and any other account where that password was reused, and to enable Multi-Factor Authentication (MFA). Checking this site regularly is a standard "best practice" for maintaining high levels of information security hygiene in a landscape where data breaches occur with increasing frequency.

NEW QUESTION # 40

What is ZAP?

- A. It is an open-source penetration testing tool used to evaluate the security of web applications.
- B. It is a term used to describe the collection and analysis of information from publicly available sources, such as websites, social networks, government databases, news articles, among other resources freely available on the web.
- C. ZAP is a closed source penetration testing tool used to evaluate online servers.

Answer: A

Explanation:

The OWASP Zed Attack Proxy (ZAP) is one of the world's most popular free, open-source security tools for finding vulnerabilities in web applications. It is actively maintained by a global community of volunteers under the Open Web Application Security Project (OWASP). ZAP acts as a "man-in-the-middle proxy," meaning it sits between the tester's web browser and the web application being tested. This allows the tester to intercept, inspect, and even modify the requests and responses traveling between the two.

ZAP provides a wide array of functionalities essential for the Web Application Pentesting process:

* Automated Scanner: It can automatically crawl a website to find vulnerabilities like SQL injection, Cross-Site Scripting (XSS), and insecure headers.

* Spidering: It maps out the structure of a website by following every link it finds.

* Fuzzing: It can send many variations of malicious input to a specific field to see if it can break the application or trigger an error.

* Active and Passive Scanning: It can passively watch traffic to find easy-to-spot issues or actively probe the server for deeper flaws.

For ethical hackers, ZAP is often compared to the commercial tool Burp Suite. While both perform similar tasks, ZAP's open-source nature and robust API make it a favorite for integrating into "DevSecOps" pipelines, where it can automatically test new code for vulnerabilities before it is deployed. Mastering ZAP is a core skill for any professional focused on securing the web-facing assets of an organization.

NEW QUESTION # 41

What is the Lhost in metasploit?

- A. Host line.
- **B. Local host.**
- C. Local hosting.

Answer: B

Explanation:

In the Metasploit Framework, LHOST stands for Local Host. This is a critical configuration variable that specifies the IP address of the attacker's (tester's) machine. When an ethical hacker deploys an exploit- particularly one that utilizes a reverse shell- the LHOST tells the victim's machine exactly where to send the connection back to.

Setting the LHOST correctly is vital for the success of an exploitation attempt. In most network environments, especially those involving NAT (Network Address Translation) or VPNs, the tester must ensure they use the IP address that is reachable by the target system. For instance, if the tester is on a local network, they would use their internal IP; however, if they are testing over a wider network or the internet, they must ensure the LHOST points to a public IP or a listener configured to handle the traffic. Along with LPORT (Local Port), LHOST defines the listener on the attacker's machine. When the exploit executes on the target (RHOST), the payload initiates a connection back to the address defined in LHOST. If this variable is misconfigured, the exploit might successfully run on the victim's end, but the tester will never receive the shell, resulting in a failed attempt. For an ethical hacker, double-checking the LHOST and LPORT settings is a standard "best practice" before launching any module to ensure a stable and reliable connection is established.

NEW QUESTION # 42

What is ethical responsibility in hacking?

- **A. Ensuring that scanning and testing are performed with proper authorization and for legitimate purposes.**
- B. Performing scanning activities with technical knowledge only.
- C. Ensuring that scanning is performed without permission and for illegitimate purposes.

Answer: A

Explanation:

Ethical responsibility in hacking refers to the obligation to perform all security testing activities legally, transparently, and with explicit authorization, making option B the correct answer. Ethical hacking is not defined solely by technical skill, but by adherence to legal boundaries, professional conduct, and organizational policies.

Ethical hackers must always obtain written permission before conducting reconnaissance, scanning, or exploitation activities. This authorization clearly defines the scope, targets, and limitations of the engagement.

Without permission, even basic scanning activities may be considered illegal or unethical, regardless of intent.

Option A is incorrect because technical knowledge alone does not make hacking ethical. Skills must be applied responsibly. Option C is incorrect because performing scans without permission is a violation of ethical and legal standards and may result in criminal charges.

From an ethical hacking perspective, responsibility also includes responsible disclosure, minimizing impact, protecting sensitive data, and reporting findings accurately. Ethical hackers must avoid data misuse, service disruption, or unnecessary system damage.

Understanding ethical responsibility is foundational to professional cybersecurity practice. It distinguishes ethical hackers from malicious actors and ensures that security testing contributes positively to risk reduction, compliance, and organizational trust.

NEW QUESTION # 43

As pentester can we exploit any vulnerability regardless of the affectations?

- **A. NO, since performing these acts without consent is a crime.**
- B. YES, we have all the freedom.
- C. YES, we have all the power to perform these processes without consent.

Answer: A

Explanation:

The defining characteristic that separates a professional penetration tester from a criminal hacker is legal authorization and consent. In the pentesting process, it is strictly prohibited to exploit any vulnerability without the explicit, written consent of the system owner.

Performing such acts without authorization-even if the intent is to "help"-is a criminal offense in most jurisdictions and can lead to severe legal consequences, including fines and imprisonment.

Before any testing begins, a "Rules of Engagement" (RoE) and a "Statement of Work" (SoW) must be signed.

These documents define the scope of the test: which systems can be touched, which exploits are allowed, and what hours the testing can take place. A pentester must also consider "affectations," meaning the potential impact on business operations. If exploiting a vulnerability has a high risk of crashing a production server or corrupting critical data, the tester must consult with the client before proceeding.

Ethical hacking is built on a foundation of trust and professional integrity. A pentester's goal is to improve security, not to disrupt business or act recklessly. If a critical vulnerability is found, the ethical response is to document it and inform the client immediately so it can be fixed. This disciplined approach ensures that the pentesting process remains a valuable security tool rather than a liability, reinforcing the fact that professional power in this field must always be balanced by strict adherence to legal and ethical standards.
