CompTIA Cloud+ (CV0-004) Certification Exam Sample Questions (Q18-Q23):

NEW QUESTION # 18

A company that has several branches worldwide needs to facilitate full access to a specific cloud resource to a branch in Spain. Other branches will have only read access. Which of the following is the best way to grant access to the branch in Spain?

- A. Set up MFA for the users working at the branch.
- B. Implement an IPS/IDS to detect unauthorized users.
- C. Create a network security group with required permissions for users in Spain.
- D. Apply a rule on the WAF to allow only users in Spain access to the resource.

Answer: C

Explanation:

The best way to grant full access to a specific cloud resource to a branch in Spain, while other branches have only read access, is to create a network security group with the required permissions.

This group can be configured to allow full access to users within the branch's IP range while restricting others to read-only access.

NEW QUESTION # 19

A cloud engineer is reviewing the following Dockerfile to deploy a Python web application:

Which of the following changes should the engineer make to the file to improve container security?

- A. Add the instruction "USER nonroot."
- B. Ensure myapp/main.py is owned by root.
- C. Change the version from latest to 3.11.
- D. Remove the ENTRYPOINT instruction.

Answer: A

Explanation:

To improve container security, the engineer should add the instruction "USER nonroot" to the Dockerfile. This change ensures that the container does not run as the root user, which reduces the risk of privilege escalation attacks. Running containers as a non-root user is a best practice for enhancing security in containerized environments.

Reference: CompTIA Cloud+ content includes security concerns, measures, and concepts for cloud operations, highlighting container security best practices such as running containers with least privilege to mitigate security risks.

NEW QUESTION # 20

Which of the following types of releases best describes the update made to a code repository production release when it changes from version 1.0 to version 1.1?

- A. Major
- B. Beta
- C. Minor
- D. Alpha

Answer: C

Explanation:

Comprehensive and Detailed Step-by-Step Explanation:

Alpha (A): Refers to pre-release software that is still in the early testing phase.

Beta (B): Indicates pre-release software that is feature-complete but requires testing.

Minor (C): Updates from version 1.0 to 1.1 signify incremental improvements or minor feature additions without significant changes.

Major (D): Involves substantial changes, often indicated by a change in the primary version number (e.g., 1.x to 2.x).

NEW QUESTION # 21

A company has ten cloud engineers working on different manual cloud deployments. In the past, engineers have had difficulty keeping deployments consistent. Which of the following is the best method to address this issue?

- A. Service logging
- B. Change ticketing
- C. Configuration as code
- D. Deployment documentation

Answer: C

Explanation:

In CompTIA Cloud+ (CV0-004) objectives covering automation, orchestration, and configuration management, the best way to ensure consistent deployments across multiple engineers is to use configuration as code (often implemented as Infrastructure as Code and configuration management). By defining infrastructure and system configuration in version-controlled templates (e.g., Terraform, CloudFormation, ARM, Ansible), the organization replaces manual, error-prone steps with repeatable, standardized builds. This reduces configuration drift, enforces approved baselines, and enables peer review and automated testing through CI/CD pipelines. When changes are required, engineers update the code, validate it, and redeploy consistently across environments, improving reliability and auditability.

Deployment documentation (A) helps, but it still relies on humans to follow steps and tends to fall out of date.

Service logging (B) improves observability but does not prevent inconsistent builds. Change ticketing (D) supports governance and approval workflows, yet it doesn't guarantee technical consistency in implementation. Therefore, configuration as code is the most effective control to achieve consistent cloud deployments at scale.

NEW QUESTION # 22

A cloud solutions architect wants to deploy a three-tier web application that requires the minimum amount of operational overhead. Which of the following is the best template given these requirements?

- A.
- B.
- C.
- D.

Answer: C

Explanation:

Chosen template leverages serverless functions for the backend, managed relational databases with clustering, and object storage with static web content enabled. This setup minimizes operational overhead by avoiding direct management of virtual machines for application and database tiers, using serverless and managed services instead. It aligns best with the requirement for minimal operational overhead in deploying a three-tier web application.
