- Karatasi hii ina kurasa nne zenye maandishi yenye sehemu A,B, C,D na E zenye maswali arobaini na tano (45).
- Jibu maswali yote katika kila sehemu ya mtihani huu.
- Jaza taarifa zote katika fomu ya OMR na ukurasa wenye swali la 41 hadi 45 nyuma ya fomu ya OMR
- Weka Kivuli katika kila tarakimu ya namba yako ya mtihani kwenye nafasi husika katika fomu ya OMR.
- Weka kivuli kwenye herufi ya jibu lililo sahihi kwa swali 1 -40. Kwa mfano jibu ni A weka kivuli kama ifuatavyo  

<input type="radio"/> A	<input type="radio"/> B	<input type="radio"/> C	<input type="radio"/> D	<input type="radio"/> E
-------------------------	-------------------------	-------------------------	-------------------------	-------------------------
- Ukigundua kuwa herufi uliyowekea kivuli si jibu sahihi futa kivuli hicho kwa umakini kwa kutumia kifutio safi kabla ya kuweka kivuli katika herufi mpya.
- Tumia penseli ya **HB** tu katika kujibu swali la 1 hadi 40; na kalamu ya bluu au nyeusi kwa swali la 41 hadi 45.

ECCouncil 312-97 Exam candidates all know the ECCouncil 312-97 exam is not easy to pass. But it is also the only way to success, so they have to choose it. In order to improve the value of your career, you must pass this certification exam. The exam questions and answers designed by Prep4cram contain different targeted, and have wide coverage. ## **ECCouncil EC-Council Certified DevSecOps Engineer (ECDE) Sample Questions (Q69-Q74):**

### **NEW QUESTION # 69**

(Brady Coleman is a senior DevSecOps engineer at CloudVac Security Private Ltd. He has created a new container named "eccbrad" from the centos:7 image using the command `docker run -i -t --name geeklab centos:7 /bin/bash`. Now, Brady wants to install the httpd package inside the eccbrad container. Which of the following commands should Brady use to install the httpd package inside the container?)

- A. `sudo install-httpd`.
- B. `sudo install httpd`.
- C. `yum install-httpd`.
- D. `yum install httpd`.

**Answer: D**

Explanation:

The CentOS operating system uses the yum package manager to install software packages. Inside a CentOS- based Docker container, the correct way to install the Apache HTTP Server is by running `yum install httpd`.

Containers typically run as the root user by default, making the use of `sudo` unnecessary. Commands such as `install-httpd` are invalid because `yum` requires the `install` keyword followed by the package name separated by a space. Installing required packages inside containers should be done carefully to avoid bloating images and increasing the attack surface. During the Operate and Monitor stage, DevSecOps teams must balance functionality with container hardening best practices by installing only necessary components.

### **NEW QUESTION # 70**

(Debra Aniston has recently joined an MNC company as a DevSecOps engineer. Her organization develops various types of software products and web applications. The DevSecOps team leader provided an application code and asked Debra to detect and mitigate security issues. Debra used w3af tool and detected cross-site scripting and SQL injection vulnerability in the source code. Based on this information, which category of security testing tools is represented by w3af?.)

- A. SAST.
- B. DAST.
- C. SCA.
- D. IAST.

**Answer: B**

Explanation:

w3af (Web Application Attack and Audit Framework) is a Dynamic Application Security Testing (DAST) tool. It analyzes running web applications by sending crafted requests and observing responses to identify vulnerabilities such as SQL injection, cross-site scripting, and authentication flaws. Unlike SAST tools, w3af does not require access to source code and instead operates externally, simulating real-world attack behavior.

SCA focuses on third-party dependencies, and IAST requires runtime instrumentation within the application.

Since Debra detected vulnerabilities by actively interacting with the application, w3af clearly represents DAST. DAST tools are especially valuable during the Build and Test stage, as they validate application behavior from an attacker's perspective before deployment.

### **NEW QUESTION # 71**

(Andrew Gerrard has recently joined an IT company that develops software products and applications as a DevSecOps engineer. His team leader asked him to download a jar application from the organization GitHub repository and run the BDD security framework. Andrew successfully downloaded the jar application from the repository and executed the jar application; then, he cloned the BDD security framework. Which of the following commands should Andrew use to execute the authentication feature?.)

- A. `./gradlew -Dcucumber.options="-tags @authentication -tags @skip"`.

- B. `./gradlew -Dcucumber.options="--tags @authentication -tags ~@skip"`.
- C. `./gradlew -Dcucumber.options="--tags @authentication -tags ~@skip"`.
- D. `./gradlew -Dcucumber.options="--tags @authentication -tags @skip"`.

**Answer: C**

Explanation:

The BDD Security framework is executed through Gradle wrapper commands, and the correct wrapper script on Unix-like systems is `./gradlew` (dot-slash indicates "run the wrapper from the current directory"). Options using `./gradlew` or `./gradlew` imply an absolute path at filesystem root and are typically incorrect for a cloned project. Also, the wrapper name is `gradlew`, not `gradlew`. For executing only the authentication feature (or scenarios tagged for authentication), Cucumber tag expressions are used through the `-Dcucumber.options` system property. The command must include `--tags @authentication` to select authentication-tagged scenarios. To skip scenarios tagged "skip," the exclusion operator is used as `--tags ~@skip` (meaning "exclude @skip"). Options A and B incorrectly include `--tags @skip` which would include skipped tests rather than exclude them. Therefore, `./gradlew -Dcucumber.options="--tags @authentication --tags ~@skip"` is the correct choice to run authentication scenarios while excluding anything marked to skip.

## NEW QUESTION # 72

(Dustin Hoffman has been working as a DevSecOps engineer in an IT company located in San Diego, California. For detecting new security vulnerabilities at the beginning of the source code development, he would like to integrate Checkmarx SCA tool with GitLab. The Checkmarx template has all the jobs defined for pipeline. Where should Dustin incorporate the Checkmarx template file `https://raw.githubusercontent.com/checkmarx-ltd/cx-flow/develop/templates/gitlab/v3/Checkmarx.gitlab-ci.yml`?)

- A. `gitlab-ci/cd.yml` root directory.
- B. `gitlab-ci.yml` root directory.
- C. `gitlab.yml` root directory.
- D. `gitlab-cd.yml` root directory.

**Answer: B**

Explanation:

GitLab CI/CD pipelines are defined using a configuration file named `gitlab-ci.yml`, which must be placed in the root directory of the repository. This file controls pipeline stages, jobs, and template inclusions. To integrate Checkmarx SCA using a predefined template, the template reference must be included in the root-level `gitlab-ci.yml` file so GitLab can load and execute the defined jobs automatically. The other filenames listed in the options are not recognized by GitLab as valid pipeline configuration files. Integrating SCA at the Code stage allows early detection of vulnerable open-source dependencies, reducing remediation cost and preventing insecure components from progressing further in the DevSecOps pipeline.

## NEW QUESTION # 73

(Brett Ryan has been working as a senior DevSecOps engineer in a multinational company that develops web applications. The team leader of the software development team requested Brett to detect insecure JavaScript libraries in the web application code. Brett would like to perform the vulnerability scanning on web application with `grunt-retire`. Which of the following commands would enable `grunt` plugin?)

- A. `grunt-loadNpmTasks('grunt-retire');`.
- B. `grunt.loadNpmTask('grunt-retire');`.
- C. `grunt.loadNpmTasks('grunt-retire');`.
- D. `grunt-loadNpmTask('grunt-retire');`.

**Answer: C**

Explanation:

In Grunt, plugins installed via npm must be explicitly loaded in the Gruntfile to make their tasks available. This is done using the `grunt.loadNpmTasks()` function, which instructs Grunt to load tasks provided by a specific plugin package. For the `grunt-retire` plugin, which scans JavaScript libraries for known vulnerabilities, the correct command is `grunt.loadNpmTasks('grunt-retire');`. Options that omit the dot notation or use the singular form `loadNpmTask` are syntactically incorrect and will prevent the plugin from loading.

Enabling grunt-retire during the Code stage allows developers to identify insecure third-party JavaScript libraries early, supporting software composition analysis and reducing the risk of introducing vulnerable dependencies into the application.
