dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q208-Q213):

NEW QUESTION # 208
You get a warning during dbt run:WARNING: Found 100 rows in 'stg_customers' that will become duplicates in the 'dim_customers' target.

- A. Investigate your dim_customers modeling logic to ensure a unique key is correctly used to prevent duplicates.
- B. It's safe to ignore this warning, as de-duplication is handled automatically by dbt.
- C. Increase the memory allocated for the database to handle the large number of duplicates.
- D. Update the stg_customers source definition to include filtering logic to remove duplicate rows.

Answer: A

Explanation:
This typically indicates a logic flaw in your model creating the target table. Modifying the source or increasing memory won't resolve the core issue.

NEW QUESTION # 209

A common dimension table is used in 80% of your models. What might be a side effect of frequently changing the structure of this dimension?

- A. It would cause errors in models that are not directly dependent on this dimension.
- B. You might need to update a large number of downstream models.
- C. Compile times would significantly increase across the project.
- D. The dbt docs output would become unmanageable.

Answer: B

Explanation:
Changing core dimensions has ripple effects on dependent models. While docs could become more complex, the primary issue is maintaining those dependencies.

NEW QUESTION # 210

(Multiple Select)

- A. Examine the source data for the model to verify the presence of expected values.
- B. Add intermediate CTEs within the model's SQL to inspect data at different transformation stages.
- C. Implement a custom data test to specifically check the column for null values.
- D. Switch the model materialization from 'view' to 'table'.

Answer: A,B

Explanation:
Verifying source data and stepwise debugging are key. Tests help but come later. Changing the materialization is unlikely to directly address the null-value issue.

NEW QUESTION # 211

You discover a vulnerability in a third-party lineage-enhancing dbt package you use. Where might you first look for information and potential fixes?

- A. Centralized dbt documentation or a discussion forum.
- B. The GitHub repository or documentation of the dbt package.
- C. Only the authors of the dbt package would be able to address the vulnerability.
- D. Directly in the manifest.json or packages.yml files within your project

Answer: B

Explanation:
The package maintainer is the primary source for updates and vulnerability fixes. However, other resources like A & C might provide additional information or community solutions.

The dbt docs command compiles metadata about your project by gathering information from three primary sources: your warehouse's information schema, your YAML configuration files, and your SQL model files. Understanding which metadata comes from which source is essential for debugging and for effective documentation practices.

Singular tests live inside .sql files within the /tests directory. Since dbt renders these tests directly from SQL files, their definitions appear in documentation sourced from that location.

Column data types come from the warehouse itself. dbt introspects the data platform information schema to retrieve actual types because dbt does not infer or define column types-only the warehouse does.

Generic tests (e.g., unique, not_null, accepted_values) are declared in .yml files. These YAML definitions contain test configurations, descriptions, and parameters, which dbt uses to document and execute these tests.

SQL code for models is naturally sourced from .sql files where the models are defined. This includes logic such as SELECT statements, CTEs, and transformations.

Column descriptions are written exclusively in .yml files. dbt never extracts descriptions from SQL comments-only from YAML. Model dependencies come from the ref() and source() calls inside .sql model files, which dbt parses to build the DAG.
