## Relativity Certified Administrator Sample Questions (Q52-Q57):

### NEW QUESTION # 52

What happens during the staging step of a production?

- A. Relativity displays a sample image showing how the branding is applied to documents in the production.
- B. Relativity assigns Bates numbers to documents.
- **C. Relativity takes a snapshot of the data sources and checks for duplicate documents between data sources.**
- D. Relativity performs a conflict check to ensure the data sources do not contain documents that are also in the saved search selected in the Production Restriction field.

**Answer: C**

Explanation:

The correct answer is B. Relativity's official production console documentation explains that Stage Production and Stage and Run Production both take a snapshot of the data sources for the production.

The staging step captures the current contents of those data sources so the production job runs against a fixed set of documents. Relativity also documents that staging errors occur if the same document is found in multiple data sources, which means duplicate-document checking is part of what administrators must evaluate during the staging phase.

The other options describe different production activities. Showing a sample image of branding is associated with Preview Production, not staging. Bates numbers are assigned later as part of the production run, not during the initial staging snapshot. The option about conflict checking against a Production Restriction saved search is not the best description of the staging step itself according to the official documentation. For RCA exam purposes, the key concept is that staging freezes the production inputs and surfaces structural issues, especially duplicate documents across data sources, before the full production run proceeds. This is an important quality-control checkpoint because it helps administrators verify that the right documents and data-source configuration are in place before branding, numbering, and export occur. Therefore, the best answer is that during staging, Relativity takes a snapshot of the data sources and checks for duplicate documents between data sources.

### NEW QUESTION # 53

You need a user to perform some admin operations, including creating groups, managing users, and assigning permissions. However, you do not want them to review the Processing or Production queues. How should you configure the user's permissions?

- A. Add the user to the Workspace Admin group.
- B. Add the user to the System Admin group and configure the System Admin group to restrict permissions to access Process and Production queues.
- **C. Add them to an instance-level group with permissions to create groups, manage users, and assign permissions.**
- D. Add the user to the System Admin group.

**Answer: C**

Explanation:

The correct answer is D. Add them to an instance-level group with permissions to create groups, manage users, and assign permissions. Relativity's instance security model allows administrators to assign instance-level permissions to groups through the Admin Security dialog. The documentation explains that permissions can be managed granularly through object security, tab visibility, and admin operations, which means a user can be given specific administrative rights without being made a full system administrator. This matters because the System Administrators group grants broad access to admin-level permissions and tabs, including queue management. Relativity's documentation specifically notes that system admins have access to all admin-level capabilities such as queue management, users, and groups tabs. If you do not want the user reviewing Processing or Production queues, giving full System Admin membership is broader than necessary. A workspace admin group is also insufficient for this requirement because creating groups, managing users, and assigning instance-level permissions are administrative functions controlled at the instance level. Therefore, the correct configuration is to place the user in an instance-level group with only the permissions they need.

### NEW QUESTION # 54

How can you configure users to be automatically disabled?

- A. At the Instance level, set an expiration date for the SSO identity provider.
- **B. At the User level, use the Disable on Date settings.**
- C. At the Instance level, use the User Expiration settings.
- D. At the User level, use the User Activity settings.

**Answer: B**

Explanation:

The correct answer is A. At the User level, use the Disable on Date settings. Relativity's Users documentation states that Disable on Date (UTC) is the field used to auto-disable users on a specific future date. It also explains that you can set this field when creating or editing an individual user, and that users will be automatically logged out and disabled on the specified date and time.

The other options are not the documented built-in mechanism for this feature. User Activity in Security Center allows admins to inspect and disable users, but it is not the setting used to preconfigure automatic disablement on a future date. Likewise, the question's instance-level settings in options B and D are not the Relativity feature described in the official Users documentation for automatic disablement. Therefore, the correct answer is Disable on Date at the user level .

#### NEW QUESTION # 55

You expect a large amount of data from the United Kingdom. What steps should you take to prepare your index for date searching?

- A. None. UK date formats are not supported.
- **B. Turn on Date Recognition before building the dtSearch index.**
- C. Add the forward slash / character to the alphabet file.
- D. Update the Native Time Zone Offset field in the dtSearch index.

**Answer: B**

Explanation:

The correct answer is B. Turn on Date Recognition before building the dtSearch index. Relativity's Searching Guide explains that date recognition must be activated before it can be used in the workspace. It also states that dtSearch recognizes valid date formats common in both the US and UK , including DD/MM /YY and DD/MM/YYYY formats. That means UK dates are supported, but the index must be configured with Date Recognition enabled in order to take advantage of date searching behavior.

This rules out option D because UK date formats are explicitly supported. Option C is incorrect because adding the slash character to the alphabet file is not the documented preparation step for date searching.

Option A is unrelated to dtSearch date-recognition configuration. From an RCA perspective, the important point is that dtSearch can recognize UK-style numeric dates, but only if Date Recognition is enabled before the relevant index build. Therefore, the correct answer is B .

#### NEW QUESTION # 56

What production numbering should be used when reproducing documents with the same Bates numbering?

- A. Document field numbering
- B. Original image numbering
- C. Page level numbering
- **D. Existing production numbering**

**Answer: D**

Explanation:

The correct answer is D. Existing production numbering . Relativity's official production set documentation states that Existing production numbering should be selected when you want to re-use the Bates numbering fields from a previously run production set . This is the exact numbering option designed for scenarios where documents are being reproduced but must retain the same Bates values from an earlier production. Relativity further explains that this option is appropriate when you need to change the produced images, produce only a subset of documents from the existing production, or otherwise reissue the same produced documents while preserving the prior numbering.

This aligns directly with re-production workflows. Relativity's re-production documentation also notes that re- production jobs reuse the numbering format and Bates numbers from the original productions , reinforcing that the platform supports maintaining the original numbering scheme instead of assigning new Bates values. That is critical in litigation workflows where Bates continuity must be preserved for references in correspondence, court filings, and prior productions. The other options do not fit this requirement. Page level numbering and document field numbering generate or rely on other numbering methods, while original image numbering is not the production numbering choice used for preserving prior Bates values in a re- production. Therefore, when reproducing documents and keeping the same Bates numbering, the correct production numbering method is Existing production numbering .
