## Topping 3V0-23.25 Practice Quiz: Advanced VMware Cloud Foundation 9.0 Storage Supply You the Most Veracious Exam Brain Dumps - Prep4away

In today's society, everyone wants to find a good job and gain a higher social status. As we all know, the internationally recognized 3V0-23.25 certification means that you have a good grasp of knowledge of certain areas and it can demonstrate your ability. This is a fair principle. But obtaining this 3V0-23.25 certificate is not an easy task, especially for those who are busy every day. We do not charge extra service fees, but the service quality is high. Your satisfaction is the greatest affirmation for us and we sincerely serve you. Our 3V0-23.25 Exam Guide deliver the most important information in a simple, easy-to-understand language that you can learn efficiently learn with high quality. Whether you are a student or an in-service person, our 3V0-23.25 exam torrent can adapt to your needs.

## VMware Advanced VMware Cloud Foundation 9.0 Storage Sample Questions (Q89-Q94):

### NEW QUESTION # 89

An Infrastructure Manager is sizing the "Operations Reserve" for a VCF 9.0 Workload Domain. The developers plan to use vSAN Data Protection with highly aggressive snapshot schedules for their CI/CD pipelines (e.g., snapshots every 15 minutes, retaining 48 hours).

...

[SDDC Manager - Capacity Configuration]

Default vSAN Thresholds

Host Rebuild Reserve: 15% (Enabled)

Operations Reserve: 5% (Customized)

...

Historically, the manager lowered the Operations Reserve to 5% to grant more capacity to VMs.

How does the interaction of heavy snapshot activity and this customized Operations Reserve directly impact the cluster's stability and

performance? (Select all that apply.)

- A. The system will fail to delete older snapshots when the retention limit is reached if the Operations Reserve is full, causing the datastore to rapidly fill to 100%.
- B. Deep snapshot chains generate significant metadata overhead; when background snapshot deletions occur, they consume temporary staging space which can quickly exhaust a 5% Operations Reserve.
- C. vSAN ESA snapshots do not consume Operations Reserve space because they are log-structured B-tree pointers, making the 5% setting perfectly safe.
- D. If the Operations Reserve is exhausted by snapshot consolidation overhead, vSAN will throttle incoming VM write I/O to zero to prevent datastore corruption.

**Answer: A,B,D**

#### NEW QUESTION # 90

A VCF Architect is designing a site disaster recovery strategy for a retail client operating a vSAN Stretched Cluster. The client's network team has imposed strict limitations on inter-site traffic, noting that the Inter-Site Link (ISL) occasionally drops packets under heavy load. The storage policy is configured with "Dual Site Mirroring" and "Secondary FTT=1 (RAID-1)". The architect is concerned about how a network partition (ISL failure) interacts with this storage policy regarding object accessibility and capacity planning.

Which of the following statements accurately describe the interaction between the network partition mechanics and the storage policy constraints? (Select all that apply.)

- A. The 'Secondary FTT=1 (RAID-1)' rule ensures that workloads on the isolated Secondary site can remain active by consuming the local replica copy without needing the Witness.
- B. The Dual Site Mirroring policy implicitly relies on the Unicast agents maintaining connectivity to the Witness appliance to establish a quorum (>50% of votes) during an ISL failure.
- C. If a network partition isolates the Secondary site from both the Preferred site and the Witness, the Secondary site's replica components will transition to the 'Inaccessible' state.
- D. A flapping network partition on the ISL could trigger a "Witness bandwidth exhaustion" event if the cluster frequently splits and merges, causing metadata resync storms.

**Answer: B,C,D**

#### NEW QUESTION # 91

A CTO is defining the StorageClass strategy for a new Tanzu Kubernetes cluster running on vSAN ESA. The workloads are heavy write-intensive databases.

The CTO is debating whether to enforce "Object Space Reservation: Thick" (100% reserved) in the SPBM policy attached to the K8s StorageClass, or leave it as the default "Thin" provisioned.

'''

[vSAN Performance / Capacity View Projection]

Option 1: Thick Provisioning (100% OSR) -> 50 TB PVCs consume 50 TB immediately.

Option 2: Thin Provisioning (0% OSR) -> 50 TB PVCs consume only written data (e.g., 5 TB initially).

'''

Which of the following statements correctly evaluate the trade-offs of enforcing "Thick" provisioning via a Kubernetes StorageClass on vSAN ESA? (Select all that apply.)

- A. Thick provisioning prevents "Out of Space" (OOS) runtime crashes for database pods; if the datastore fills up, the thick-provisioned database is already guaranteed its 50 TB.
- B. Thick provisioning on vSAN ESA accelerates database write performance by zeroing out the physical NVMe blocks during PVC creation.
- C. Using "Thin" provisioning creates a race condition where thousands of K8s pods could oversubscribe the datastore, causing an APD event when physical space runs out.
- D. Kubernetes CSI drivers are incompatible with Thick provisioning; the feature was deprecated in vSphere 8.0.
- E. In vSAN ESA, "Thick" provisioning does not pre-allocate physical NVMe blocks; instead, it logically reserves the capacity quota in the DOM to guarantee space for the pod's lifetime.

**Answer: A,C,E**

### NEW QUESTION # 92

A Cloud Administrator configures a Secure Disaster Recovery topology for a VCF 9.0 environment. The Primary Site uses a vSAN ESA cluster with Data-at-Rest Encryption enabled.

The Secondary Site also uses vSAN ESA with Data-at-Rest Encryption.

The Administrator configures vSphere Replication to replicate a Tier-1 VM from Primary to Secondary.

...

[Storage Policy Rule Set]

Source SPBM: ESA-RAID5-Encrypted

Target SPBM: ESA-RAID6-Encrypted

...

How is the data security handled throughout the lifecycle of this replication process, from source disk to target disk? (Select all that apply.)

- A. The VM's data is decrypted by the source ESXi host as it is read from the vSAN datastore, and enters the vSphere Replication appliance network buffer in cleartext.
- B. To secure the data in transit across the WAN, the administrator must explicitly enable "Network Traffic Encryption" in the vSphere Replication advanced settings for the VM.
- C. vSphere Replication automatically maps the source Guest OS bitlocker keys to the target site using the vCenter API.
- D. Upon arrival at the Secondary site, the target vSAN datastore encrypts the incoming data using the Secondary site's own local Disk Encryption Keys (DEKs) before destaging it to NVMe.
- E. The encrypted data blocks are sent raw across the wire; the target vSAN cluster must import the Primary Site's Key Encryption Key (KEK) to read the data.

**Answer: A,B,D**

### NEW QUESTION # 93

A Storage Administrator uses the Ruby vSphere Console (RVC) to diagnose a massive host isolation event in a vSAN ESA cluster.

...

[RVC Output: vsan.cluster\_info ~cluster]

Host: esx-04

Network Status: Partitioned (Isolated)

CMMDS Master: Self (Partition Group size: 1)

...

esx-04 has completely lost vSAN network connectivity (an effective internal APD for its remote replicas).

How do the vSphere HA "Host Isolation Response" and the vSAN "Inaccessible Object" mechanics fuse to handle the Virtual Machines currently running on the isolated host esx-04?

(Select all that apply.)

- A. esx-04 continues to run the VMs normally using only local storage cache, entering a "degraded active" mode.
- B. esx-04 is isolated. It cannot see the rest of the cluster (no quorum). The vSAN DOM on esx-04 immediately marks all VM storage objects as "Inaccessible", freezing the VMs to prevent split-brain.
- C. If vSphere HA "Host Isolation Response" is set to "Power Off and Restart VMs", esx-04 will forcibly terminate its local frozen VMs.
- D. The surviving cluster (which has the CMMDS Master and Quorum) detects that esx-04 is dead, and the vSphere HA Master on the surviving side initiates the boot-up sequence to restart the VMs.
- E. RVC automatically generates a PDL condition on the remaining hosts to wipe the duplicate data.

**Answer: B,C,D**
