Health Status: HEALTHY
Failover Readiness: READY

Referring to the exhibit, which statement is true?

- A. If SRG1 moves to peer 2, peer 1 will forward packets sent to the SRG1 interfaces.
- B. SRG1 is configured in hybrid mode.
- C. The ICL is encrypted.
- D. If SRG1 moves to peer 2, peer 1 will drop packets sent to the SRG1 interfaces.

Answer: A

Explanation:

The exhibit describes a Chassis Cluster configuration with high availability (HA) settings. The key information is related to Service Redundancy Group 1 (SRG1) and its failover behavior between the two peers.

In a typical SRX HA setup with active/backup configuration, if the SRG1 group moves to peer 2 (the backup), peer 1 (previously the active node) will forward packets to peer 2 instead of dropping them. This ensures smooth failover and seamless continuation of services without packet loss. This behavior is part of the active/backup failover process in SRX chassis clusters, where the standby peer takes over traffic processing without disruption.
