What's more, 305-300 Training Materials contain both questions and answers, and it's convenient for you to check the answers after practicing.

Lpi LPIC-3 Exam 305: Virtualization and Containerization Sample Questions (Q85-Q90):

NEW QUESTION # 85

Which virtualization platforms can Vagrant be used with? (Select all that apply)

- A. Haws
- B. Docker
- C. VMware
- D. VirtualBox

Answer: B,C,D

Explanation:

Vagrant supports multiple providers, allowing it to work with different virtualization and container platforms.

According to official Vagrant documentation, supported providers include VirtualBox, VMware, and Docker.

VirtualBox is the default and most commonly used provider. VMware is supported through official plugins.

Docker is also supported as a provider, enabling lightweight container-based development environments.

Option D ("Haws") is an apparent typographical error and does not correspond to a valid virtualization platform. While Vagrant can integrate with AWS via community or third-party plugins, the option as written is invalid.

Therefore, the correct answers are A, B, and C.

NEW QUESTION # 86

Which of the following statements are true about sparse images in the context of virtual machine storage? (Choose two.)

- A. Sparse images allocate backend storage at the first usage of a block.
- B. Sparse images can only be used in conjunction with paravirtualization.
- C. Sparse images are automatically shrunk when files within the image are deleted.
- D. Sparse images are automatically resized when their maximum capacity is about to be exceeded.
- E. Sparse images may consume an amount of space different from their nominal size.

Answer: A,E

Explanation:

Explanation

Sparse images are a type of virtual disk images that grow in size as data is written to them, but do not shrink when data is deleted from them. Sparse images may consume an amount of space different from their nominal size, which is the maximum size that the image can grow to. For example, a sparse image with a nominal size of 100 GB may only take up 20 GB of physical storage if only 20 GB of data is written to it. Sparse images allocate backend storage at the first usage of a block, which means that the physical storage is only used when the virtual machine actually writes data to a block. This can save storage space and improve performance, as the image does not need to be pre-allocated or zeroed out.

Sparse images are not automatically shrunk when files within the image are deleted, because the virtual machine does not inform the host system about the freed blocks. To reclaim the unused space, a special tool such as `virt-sparsify`¹ or `qemu-img`² must be used to compact the image. Sparse images can be used with both full virtualization and paravirtualization, as the type of virtualization does not affect the format of the disk image. Sparse images are not automatically resized when their maximum capacity is about to be exceeded, because this would require changing the partition table and the filesystem of the image, which is not a trivial task. To resize a sparse image, a tool such as `virt-resize`³ or `qemu-img`² must be used to increase the nominal size and the filesystem size of the image. References: 1 (search for "virt-sparsify"), 2 (search for "qemu-img"), 3 (search for "virt-resize").

NEW QUESTION # 87

What are some benefits of using Packer for image building? (Select all that apply)

- A. Improved security through automated patching
- B. Built-in monitoring and logging
- C. Faster provisioning of virtual machines
- D. Consistency in machine images across different environments

Answer: C,D

Explanation:

Packer is designed to automate machine image creation, which leads to faster provisioning of virtual machines (C) because prebuilt images eliminate repetitive configuration steps at deployment time. Another primary benefit is consistency across environments (D), ensuring that development, testing, and production systems are built from the same image.

Packer does not provide built-in monitoring, and while it can apply patches during image creation, automated patching is not its primary or guaranteed function.

Thus, the correct answers are C and D.

NEW QUESTION # 88

What kind of virtualization is implemented by LXC?

- A. Paravirtualization
- B. CPU emulation
- C. System containers
- D. Application containers
- E. Hardware containers

Answer: C

NEW QUESTION # 89

Which of the following statements in a Dockerfile leads to a container which outputs hello world? (Choose two.)

- A. ENTRYPOINT ["echo", "hello", "world"]
- B. ENTRYPOINT "echo Hello World"
- C. ENTRYPOINT echo Hello World
- D. ENTRYPOINT "echo", "Hello", "World"
- E. ENTRYPOINT ["echo hello world"]

Answer: A,E
