MSSC Certified Logistics Technician (CLT) 4.0 Sample Questions (Q20-Q25):

NEW QUESTION # 20

Which of the following is a method used by logistics companies to reduce mistakes in logistics records caused by human entry error?

- A. hiring quality control personnel to inspect every order prior to shipping
- B. eliminating automated retrieval process and replacing with human retrieval options
- C. following up with customer on their satisfaction levels
- D. automating the data entry and retrieval process

Answer: D

Explanation:

The CLT "Inventory Control and Data Accuracy" standards emphasize automation of data entry and retrieval processes as the most effective method to reduce human error in logistics records. Automation integrates barcode scanning, RFID, and WMS systems to capture real-time data directly from material handling activities. This minimizes manual input errors such as miscounts or transposed digits. Automated data collection improves traceability, accelerates information flow, and supports immediate decision-making across the supply chain. While quality inspections remain necessary, relying solely on human verification is inefficient. CLT stresses

that technology-driven accuracy enhances performance, lowers rework costs, and ensures that records reflect true inventory positions, enabling precise forecasting and order fulfillment.

NEW QUESTION # 21

A system for standardizing and harmonizing the classification and labeling of chemicals is

- A. JIT
- B. FIFO
- C. LIFO
- **D. GHS**

Answer: D

Explanation:

The Globally Harmonized System (GHS) standardizes chemical classification, hazard statements, pictograms, signal words, and Safety Data Sheet (SDS) formats. CLT highlights GHS as the framework used across workplaces and supply chains to ensure consistent hazard communication, enabling safe handling, storage, and transport alignment with OSHA/DOT adoption of GHS elements.

NEW QUESTION # 22

When is the final time the distribution center can impact the condition and accuracy of the outbound order?

- **A. prior to outbound order leaving the facility**
- B. after receiving inspection
- C. immediately after inbound order processing
- D. prior to labeling and after bar code scanning

Answer: A

Explanation:

The final opportunity for a distribution center (DC) to influence order quality is before the outbound shipment leaves the facility. CLT "Packaging and Shipment" standards specify that packaging, inspection, and load verification occur at this final checkpoint. Once the carrier accepts the load, responsibility transfers, making pre-departure verification critical. Quality checks include confirming order accuracy, packaging integrity, labeling, and seal placement. Errors caught later can result in returns, customer dissatisfaction, and added freight costs. The CLT emphasizes creating standard exit procedures, including documentation audits and condition checks at dock doors, to ensure every shipment meets regulatory and customer requirements prior to release.

NEW QUESTION # 23

Which of the following types of pallets offers an ability to handle extremely heavy loads?

- A. corrugated pallets
- B. wood pallets
- C. rubber pallets
- **D. metal pallets**

Answer: D

Explanation:

Metal pallets, as described in CLT training materials under "Product Storage and Equipment," are designed for durability and high weight-bearing capacity. Constructed from steel or aluminum, these pallets are ideal for heavy industrial goods, automotive parts, and environments where hygiene or heat resistance is critical. They outperform wood pallets in strength and longevity, resisting impact, moisture, and infestation. While wood pallets are cost-effective and common, their load capacity is limited, and corrugated or rubber pallets are suited for light-duty or specialty applications. The CLT emphasizes matching pallet material to load requirements to maintain safety and efficiency. Using metal pallets also reduces contamination risk and is often required in clean manufacturing or food environments. Proper load distribution and pallet inspection are essential to prevent damage and ensure stable stacking within racking systems.

NEW QUESTION # 24

Which of the following consists of component inventory used to feed into production or manufacturing lines?

- A. Work-in-Progress (WIP)
- **B. Raw material stock**
- C. Finished goods
- D. Just-In-Time (JIT)

Answer: B

Explanation:

Raw material stock refers to the unprocessed inputs stored for use in manufacturing. The CLT "Inventory Control" standards distinguish among three major categories: raw materials, work-in-progress (WIP), and finished goods. Raw materials are held in inventory to feed production lines, ensuring continuity of manufacturing operations. Effective management prevents production delays while avoiding overstock. CLT emphasizes that raw material inventories must be closely coordinated with procurement and production schedules—often managed through systems like MRP or JIT. Proper labeling, storage, and traceability of raw materials are vital for quality control and compliance with industry regulations. Unlike WIP (partially completed items), raw materials are inputs awaiting transformation into finished goods.
