## HPE6-A85 PDF Question - Detailed HPE6-A85 Study Plan

Aruba Campus Access Associate Exam exam tests hired dedicated staffs to update the contents of the data on a daily basis. Our industry experts will always help you keep an eye on changes in the exam syllabus, and constantly supplement the contents of HPE6-A85 test guide. Therefore, with our study materials, you no longer need to worry about whether the content of the exam has changed. You can calm down and concentrate on learning. At the same time, the researchers hired by HPE6-A85 Test Guide is all those who passed the HPE6-A85 exam, and they all have been engaged in teaching or research in this industry for more than a decade. They have a keen sense of smell on the trend of changes in the exam questions. Therefore, with the help of these experts, the contents of HPE6-A85 exam questions must be the most advanced and close to the real exam.

HP HPE6-A85 exam is a multiple-choice exam that consists of 60 questions. HPE6-A85 exam is available in English and Japanese and can be taken at Pearson VUE testing centers worldwide. Candidates have 90 minutes to complete the exam, and the passing score is 70%. HPE6-A85 Exam Fee is \$125, and candidates can register for the exam on the Pearson VUE website.

### HP Aruba Campus Access Associate Exam Sample Questions (Q102-Q107):

#### NEW QUESTION # 102

What are two advantages of a UXI? (Select two.)

- A. A UXI can be used without any internet connection
- **B. A UXI behaves like a client/user**
- C. A UXI measures the Wi-Fi coverage of all APs in the given location.
- **D. A UXI can check different applications, such as HTTP VOIP or Office 365.**
- E. A UXI helps to calculate the best WiFi channels in a remote location

**Answer: B,D**

#### NEW QUESTION # 103

What does the status of "ALFOE" mean when checking LACP with "show lacp interfaces"?

- A. The interface on the local switch is configured as static-LAG
- **B. LACP is not configured on the peer side**
- C. LACP is in a synchronizing process
- D. LACP is working fine with no problems

**Answer: B**

Explanation:

When checking the status of LACP (Link Aggregation Control Protocol) with the command "show lacp interfaces," various flags indicate the state of the LACP negotiation. "ALFOE" indicates different states for each letter: A (Activity), L (Link), F (Aggregation), O (Synchronization), and E (Collecting). In this context, the O flag is particularly of interest. If the O flag is not set (meaning the synchronization is not achieved), it typically suggests that LACP is not configured or not functioning correctly on the peer side, hence the link is not operational as part of an LACP channel.

#### NEW QUESTION # 104

What can be done to dynamically set the PoE Priority on a switch port when deploying IP cameras APs. and other PoE devices?

- A. Enable Quick PoE on the switch modules
- **B. Enable profiling for device provisioning**
- C. Configure PoE power management to Class-based Mode
- D. Configure PoE power management to Dynamic Mode

**Answer: B**

Explanation:

Explanation

Profiling is a feature that allows Aruba switches to automatically identify and classify devices connected to them based on various attributes such as MAC address, DHCP options, LLDP information, etc. Profiling can be used to dynamically set the PoE priority on a switch port based on the device type and power requirements.

For example, an IP camera may have a higher PoE priority than a printer or a PC. Profiling can also be used to apply other configuration settings such as VLANs, ACLs, QoS, etc. based on the device profile.

### NEW QUESTION # 105

Describe the purpose of the administrative distance

- A. Routes learned via external BGP have a higher administrative distance than routes learned via OSPF
- **B. The administrative distance is used as a trust rating for route entries**
- C. The administrative distance for a static route is 10
- D. The higher administrative distance is preferred

**Answer: B**

### NEW QUESTION # 106

Where are wireless client roaming decisions made?

- **A. Client device**
- B. Virtual Controller
- C. Joint decision made by the origination and destination APs
- D. Aruba Central

**Answer: A**

Explanation:

Wireless client roaming decisions are made by the client device based on its own criteria, such as signal strength, noise level, data rate, etc. The network can influence the client's roaming decision by providing information such as neighbor reports, load balancing, band steering, etc., but the final decision is up to the client. Reference:

[https://www.arubanetworks.com/techdocs/Instant\\_86\\_WebHelp/Content/instant-ug/wlan-roaming/client-roaming.htm](https://www.arubanetworks.com/techdocs/Instant_86_WebHelp/Content/instant-ug/wlan-roaming/client-roaming.htm) Wireless client roaming decisions are primarily made by the client device itself. The client device monitors the signal strength and quality of the current connection and decides to roam to a different Access Point (AP) when the current signal deteriorates below a certain threshold or a better option is available. While APs and controllers can provide information and support for roaming decisions through protocols like 802.11k and 802.11v, the ultimate decision to roam is made by the client device based on its algorithms and thresholds.
