We attach great importance on the quality of our 305-300 exam dumps. Every product will undergo a strict inspection process. The quality of our 305-300 study guide deserves your trust. The most important thing for preparing the exam is reviewing the essential point. Almost all questions and answers of the real exam occur on our 305-300 practice materials. That means if you study our 305-300 training prep, your passing rate is much higher than other candidates.

To prepare for the LPIC-3 Exam 305: Virtualization and Containerization, candidates should have a solid understanding of Linux-based operating systems and virtualization technologies. They should also have experience with containerization tools such as Docker and be familiar with the principles of virtualization security and management. There are many resources available to help candidates prepare for this certification exam, including study guides, practice tests, and online training courses.

Lpi 305-300 Certification is an industry-recognized certification for IT professionals who work with virtualization and containerization technologies. LPIC-3 Exam 305: Virtualization and Containerization certification is an excellent way for IT professionals to demonstrate their skills and knowledge in virtualization and containerization. LPIC-3 Exam 305: Virtualization and Containerization certification also provides a competitive edge to IT professionals who want to advance their careers in the field of virtualization and containerization.

Sample 305-300 Test Online & 305-300 Valid Exam Dumps

DumpsFree are supposed to help you pass the exam smoothly. Don't worry about channels to the best 305-300 study materials because we are the exactly best vendor in this field for more than ten years. And so many exam candidates admire our generosity of the 305-300 Practice Questions offering help for them. Up to now, no one has ever challenged our leading position of this area. With our 305-300 training guide, you will be doomed to pass the exam successfully.

Lpi LPIC-3 Exam 305: Virtualization and Containerization Sample Questions (Q64-Q69):

NEW QUESTION # 64

Which of the following commands lists all differences between the disk images vml-snap.img and vml.img?

- A. virt-cp-in -a vml-snap.img -A vml.img
- B. virt-delta -a vml-snap.img -A vml.img
- C. virt-history -a vml-snap.img -A vml.img
- D. virt-cmp -a vml-snap.img -A vml.img
- E. virt-diff -a vml-snap.img -A vml.img

Answer: E

NEW QUESTION # 65

Which of the following resources can be limited by libvirt for a KVM domain? (Choose two.)

- A. Size of available memory
- B. Number of available files
- C. Amount of CPU time
- D. Number of running processes
- E. File systems allowed in the domain

Answer: A,C

Explanation:

Libvirt is a toolkit that provides a common API for managing different virtualization technologies, such as KVM, Xen, LXC, and others. Libvirt allows users to configure and control various aspects of a virtual machine (also called a domain), such as its CPU, memory, disk, network, and other resources. Among the resources that can be limited by libvirt for a KVM domain are:

* Amount of CPU time: Libvirt allows users to specify the number of virtual CPUs (vCPUs) that a domain can use, as well as the CPU mode, model, topology, and tuning parameters. Users can also set the CPU shares, quota, and period to control the relative or absolute amount of CPU time that a domain can consume. Additionally, users can pin vCPUs to physical CPUs or NUMA nodes to improve performance and isolation. These settings can be configured in the domain XML file under the <cpu> and <cpuTune> elements¹².

* Size of available memory: Libvirt allows users to specify the amount of memory that a domain can use, as well as the memory backing, tuning, and NUMA node parameters. Users can also set the memory hard and soft limits, swap hard limit, and minimum guarantee to control the memory allocation and reclaim policies for a domain. These settings can be configured in the domain XML file under the <memory>, <memoryBacking>, and <memTune> elements¹³.

The other resources listed in the question are not directly limited by libvirt for a KVM domain. File systems allowed in the domain are determined by the disk and filesystem devices that are attached to the domain, which can be configured in the domain XML file under the <disk> and <filesystem> elements¹⁴. Number of running processes and number of available files are determined by the operating system and the file system of the domain, which are not controlled by libvirt.

NEW QUESTION # 66

After creating a new Docker network using the following command:

```
docker network create --driver bridge isolated_nw
```

which parameter must be added to docker create in order to attach a container to the network?

- A. `--eth0=isolated_nw`
- B. `--alias=isolated_nw`
- C. `--attach=isolated_nw`
- D. `--ethernet=isolated_nw`
- E. `--network=isolated_nw`

Answer: E

NEW QUESTION # 67

Which of the following are true regarding the CPU of a QEMU virtual machine? (Choose two.)

- A. Each QEMU virtual machine can only have one CPU with one core.
- B. For each QEMU virtual machine, one dedicated physical CPU core must be reserved.
- C. QEMU virtual machines support multiple virtual CPUs in order to run SMP systems.
- D. QEMU uses the concept of virtual CPUs to map the virtual machines to physical CPUs.
- E. The CPU architecture of a QEMU virtual machine is independent of the host system's architecture.

Answer: C,E

Explanation:

The CPU architecture of a QEMU virtual machine is independent of the host system's architecture. QEMU can emulate many CPU architectures, including x86, ARM, Alpha, and SPARC, regardless of the host system's architecture¹. This allows QEMU to run guest operating systems that are not compatible with the host system's hardware. Therefore, option A is correct. QEMU virtual machines support multiple virtual CPUs in order to run SMP systems. QEMU uses the concept of virtual CPUs (vCPUs) to map the virtual machines to physical CPUs. Each vCPU is a thread that runs on a physical CPU core. QEMU allows the user to specify the number of vCPUs and the CPU model for each virtual machine. QEMU can run SMP systems with multiple vCPUs, as well as single-processor systems with one vCPU². Therefore, option E is also correct. The other options are incorrect because they do not describe the CPU of a QEMU virtual machine. Option B is wrong because QEMU virtual machines can have more than one CPU with more than one core. Option C is wrong because QEMU does not require a dedicated physical CPU core for each virtual machine. QEMU can share the physical CPU cores among multiple virtual machines, depending on the load and the scheduling policy. Option D is wrong because QEMU does not use the term CPU, but vCPU, to refer to the virtual machines' processors.

NEW QUESTION # 68

What is true about `containerd`?

- A. It is a text file format defining the build process of containers.
- B. It uses `runc` to start containers on a container host.
- C. It is the initial process run at the start of any Docker container.
- D. It requires the Docker engine and Docker CLI to be installed.
- E. It runs in each Docker container and provides DHCP client functionality

Answer: B
