## **SPLK-1002 Practice Exam Pdf - Valid SPLK-1002 Exam Questions**

TestsDumps is a website which is able to speed up your passing the Splunk certification SPLK-1002 exams. Our Splunk certification SPLK-1002 exam question bank is produced by TestsDumps's experts's continuously research of outline and previous exam. When you are still struggling to prepare for passing the Splunk certification SPLK-1002 Exams, please choose TestsDumps's latest Splunk certification SPLK-1002 exam question bank, and it will brings you a lot of help.

## Splunk Core Certified Power User Exam Sample Questions (Q226-Q231):

### NEW QUESTION # 226

What does the Splunk Common Information Model (CIM) add-on include? (select all that apply)

- A. Automatic data model acceleration
- **B. Fields and event category tags**
- C. Pre-configured data models
- **D. Custom visualizations**

**Answer: B,D**

### NEW QUESTION # 227

Which of the following statements about calculated fields in Splunk is true?

- A. Calculated fields can only be used in saved reports.
- **B. Calculated fields can be chained together to create more complex fields.**
- C. Calculated fields can only be used in dashboards.
- D. Calculated fields cannot be chained together to create more complex fields

**Answer: B**

Explanation:

The correct answer is B. Calculated fields can be chained together to create more complex fields.

Calculated fields are fields that are added to events at search time by using eval expressions. They can be used to perform calculations with the values of two or more fields already present in those events. Calculated fields can be defined with Splunk Web or in the props.conf file. They can be used in searches, reports, dashboards, and data models like any other extracted field<sup>1</sup>.

Calculated fields can also be chained together to create more complex fields. This means that you can use a calculated field as an input for another calculated field. For example, if you have a calculated field named `total` that sums up the values of two fields named `price` and `tax`, you can use the `total` field to create another calculated field named `discount` that applies a percentage discount to the `total` field. To do this, you need to define the `discount` field with an eval expression that references the `total` field, such as:

`discount = total * 0.9`

This will create a new field named `discount` that is equal to 90% of the `total` field value for each event<sup>2</sup>.

### NEW QUESTION # 228

What is required for a macro to accept three arguments?

- **A. The macro's name ends with (3).**
- B. Nothing, all macros can accept any number of arguments.
- C. The macro's argument count setting is 3 or more.
- D. The macro's name starts with (3).

**Answer: A**

Explanation:

To create a macro that accepts arguments, you must include the number of arguments in parentheses at the end of the macro name<sup>1</sup>. For example, `my_macro(3)` is a macro that accepts three arguments. The number of arguments in the macro name must match the number of arguments in the definition<sup>1</sup>. Therefore, option A is correct, while options B, C and D are incorrect.

### NEW QUESTION # 229

What does the following search do?

□

- A. Creates a table that groups the total number of users by vegetarian corndogs.
- B. Creates a table with the count of all types of corndogs eaten split by user.
- **C. Creates a table of the total count of mysterymeat corndogs split by user.**
- D. Creates a table of the total count of users and split by corndogs.

**Answer: C**

#### NEW QUESTION # 230

What is the purpose of a calculated field?

- A. To manually add and remove fields at search time related to statistical functions.
- B. To automatically add fields to the index using an eval expression rather than manually including an eval command.
- C. To manually add fields at search time and check for syntax errors.
- **D. To automatically add fields at search time using an eval expression rather than manually including an eval command.**

**Answer: D**

Explanation:

A calculated field in Splunk is designed to automatically add fields at search time using an eval expression.

This feature allows users to define new fields based on existing data without needing to manually include an eval command in every search. Calculated fields simplify repeated search tasks by embedding the eval logic directly into the field configuration.
