## Reliable GH-500 Exam Papers - GH-500 Trustworthy Dumps

As promising learners in this area, every exam candidates need to prove self-ability to working environment to get higher chance and opportunities for self-fulfillment. Our GH-500 practice materials with excellent quality and attractive prices are your ideal choices which can represent all commodities in this field as exemplary roles. Even the fierce competition cannot stop demanding needs from exam candidates. To get more specific information about our GH-500 practice materials, we are here to satisfy your wish with following details.

## Microsoft GitHub Advanced Security Sample Questions (Q84-Q89):

### NEW QUESTION # 84

Where can you find the vulnerable dependencies that GitHub detected in your repository?

- A. in Dependabot alerts
- B. in secret scanning alerts
- C. in security advisories

- D. in code scanning alerts

**Answer: A**

Explanation:

Identifying vulnerabilities in your project's dependencies with Dependabot alerts Dependabot generates Dependabot alerts when known vulnerabilities are detected in dependencies that your project uses.

Dependabot alerts tab

If GitHub discovers insecure dependencies in your project, you can view details on the Dependabot alerts tab of your repository. Then, you can update your project to resolve or dismiss the alert.

#### NEW QUESTION # 85

Assuming that notification settings and Dependabot alert recipients have not been customized, which user account setting should you use to get an alert when a vulnerability is detected in one of your repositories?

- A. enable by default for new public repositories
- B. enable all in existing repositories
- C. enable all for Dependabot alerts
- D. enable all for Dependency graph

**Answer: C**

Explanation:

To ensure you're notified whenever a vulnerability is detected via Dependabot, you must enable alerts for Dependabot in your personal notification settings. This applies to both new and existing repositories. It ensures you get timely alerts about security vulnerabilities.

[Not C] The dependency graph must be enabled for scanning, but does not send alerts itself.

#### NEW QUESTION # 86

A secret scanning alert should be closed as "used in tests" when a secret is:

- A. In a test file.
- B. Solely used for tests.
- C. Not a secret in the production environment.
- D. In the readme.md file.

**Answer: B**

Explanation:

If a secret is intentionally used in a test environment and poses no real-world security risk, you may close the alert with the reason "used in tests". This helps reduce noise and clarify that the alert was reviewed and accepted as non-critical.

Just being in a test file isn't enough unless its purpose is purely for testing.

#### NEW QUESTION # 87

Assuming that default security and analysis settings have not been changed at the repository, organization, or enterprise level, which scenario would generate a dependency graph for the repository?

- A. when a private repository is forked to be used as a dependent
- B. when a public repository has a new dependency added to its manifest file
- C. when a public repository is forked to be used as a dependent
- D. when a private repository has a new dependency added to its manifest file

**Answer: D**

Explanation:

A dependency graph for a private repository on platforms like GitHub is generated or updated when a new dependency is added to its manifest file and this change is pushed to the repository's default branch, How it Works:

1. Manifest File Update: You add a new dependency to a manifest file (e.g., package.json for npm).
2. Push to Default Branch: You then push the changes to your repository's default branch.

3. Automated Parsing: The platform automatically scans the manifest and lock files in the repository.
4. Graph Generation: It uses this information to construct the dependency graph, which shows direct and transitive dependencies, their versions, and any known vulnerabilities.

### NEW QUESTION # 88

Who can fix a code scanning alert on a private repository?

- A. users who have Write access to the repository
- B. users who have the security manager role within the repository
- C. users who have the Triage role within the repository
- D. users who have Read permissions within the repository

**Answer: A**

Explanation:

Resolving code scanning alerts

From the security view, you can view, fix, or dismiss alerts for potential vulnerabilities or errors in your project's code.

Who can use this feature?

Users with write access

Note: Fixing an alert manually

Anyone with write permission for a repository can fix an alert by committing a correction to the code. If the repository has code scanning scheduled to run on pull requests, it's best to raise a pull request with your correction. This will trigger code scanning analysis of the changes and test that your fix doesn't introduce any new problems.

### NEW QUESTION # 89

.....

We believe that the greatest value of GH-500 training guide lies in whether it can help candidates pass the examination, other problems are secondary. And at this point, our GH-500 study materials do very well. We can proudly tell you that the passing rate of our GH-500 Exam Questions is close to 100 %. That is to say, almost all the students who choose our products can finally pass the exam. What are you waiting for? Just rush to buy our GH-500 learning braindumps!
