

Databricks Databricks-Certified-Data-Analyst-Associate Online Prüfungen & Databricks-Certified-Data-Analyst-Associate Schulungsangebot

P.S. Kostenlose und neue Databricks-Certified-Data-Analyst-Associate Prüfungsfragen sind auf Google Drive freigegeben von ZertFragen verfügbar: https://drive.google.com/open?id=1X3FJJf03re3iKZnLZ_7pM8AacARb1L5Y

Bevor Sie sich für ZertFragen entscheiden, können Sie die Databricks Databricks-Certified-Data-Analyst-Associate Examensfragen und antworten teilweise als Probe kostenlos herunterladen. So können Sie die Glaubwürdigkeit vom ZertFragen testen. Der ZertFragen ist die beste Wahl für Sie, wenn Sie die Databricks Databricks-Certified-Data-Analyst-Associate Zertifizierungsprüfung unter Garantie bestehen wollen. Wenn Sie sich für den ZertFragen entscheiden, wird der Erfolg auf Sie zukommen.

Databricks Databricks-Certified-Data-Analyst-Associate Prüfungsplan:

Thema	Einzelheiten
Thema 1	• Databricks SQL: This topic discusses key and side audiences, users, Databricks SQL benefits, complementing a basic Databricks SQL query, schema browser, Databricks SQL dashboards, and the purpose of Databricks SQL endpoints • warehouses. Furthermore, the delves into Serverless Databricks SQL endpoint • warehouses, trade-off between cluster size and cost for Databricks SQL endpoints • warehouses, and Partner Connect. Lastly it discusses small-file upload, connecting Databricks SQL to visualization tools, the medallion architecture, the gold layer, and the benefits of working with streaming data.
Thema 2	• Data Management: The topic describes Delta Lake as a tool for managing data files, Delta Lake manages table metadata, benefits of Delta Lake within the Lakehouse, tables on Databricks, a table owner's responsibilities, and the persistence of data. It also identifies management of a table, usage of Data Explorer by a table owner, and organization-specific considerations of PII data. Lastly, the topic it explains how the LOCATION keyword changes, usage of Data Explorer to secure data.
Thema 3	• Data Visualization and Dashboarding: Sub-topics of this topic are about of describing how notifications are sent, how to configure and troubleshoot a basic alert, how to configure a refresh schedule, the pros and cons of sharing dashboards, how query parameters change the output, and how to change the colors of all of the visualizations. It also discusses customized data visualizations, visualization formatting, Query Based Dropdown List, and the method for sharing a dashboard.
Thema 4	• Analytics applications: It describes key moments of statistical distributions, data enhancement, and the blending of data between two source applications. Moreover, the topic also explains last-mile ETL, a scenario in which data blending would be beneficial, key statistical measures, descriptive statistics, and discrete and continuous statistics.

Thema 5	SQL in the Lakehouse: It identifies a query that retrieves data from the database, the output of a SELECT query, a benefit of having ANSI SQL, access, and clean silver-level data. It also compares and contrasts MERGE INTO, INSERT TABLE, and COPY INTO. Lastly, this topic focuses on creating and applying UDFs in common scaling scenarios.

Databricks-Certified-Data-Analyst-Associate Unterlagen mit echte Prüfungsfragen der Databricks Zertifizierung

ZertFragen Website ist voll mit Ressourcen und den Fragen der Databricks Databricks-Certified-Data-Analyst-Associate Prüfung ausgestattet. Es umfasst auch den Databricks Databricks-Certified-Data-Analyst-Associate Praxis-Test und Prüfungsspeicherung. Sie wird den Kandidaten helfen, sich gut auf die Prüfung vorzubereiten und die Prüfung zu bestehen, was Ihnen viel Angenehmlichkeiten bietet. Sie können die Demo zur Databricks Databricks-Certified-Data-Analyst-Associate Prüfung teilweise als Probe herunterladen. ZertFragen bietet eine echte und umfassende Prüfungsfragen und Antworten. Mit unserer exklusiven Online Databricks Databricks-Certified-Data-Analyst-Associate Prüfungsschulungsunterlagen werden Sie leicht das Databricks Databricks-Certified-Data-Analyst-Associate Exam bestehen. Unsere Website gewährleistet Ihnen eine 100%-Pass-Garantie.

Databricks Certified Data Analyst Associate Exam Databricks-Certified-Data-Analyst-Associate Prüfungsfragen mit Lösungen (Q50-Q55):

50. Frage

Which of the following layers of the medallion architecture is most commonly used by data analysts?

- A. All of these layers are used equally by data analysts
- B. Silver
- C. None of these layers are used by data analysts
- **D. Gold**
- E. Bronze

Antwort: D

Begründung:

The gold layer of the medallion architecture contains data that is highly refined and aggregated, and powers analytics, machine learning, and production applications. Data analysts typically use the gold layer to access data that has been transformed into knowledge, rather than just information. The gold layer represents the final stage of data quality and optimization in the lakehouse. Reference: What is the medallion lakehouse architecture?

51. Frage

A data analyst is working with gold-layer tables to complete an ad-hoc project. A stakeholder has provided the analyst with an additional dataset that can be used to augment the gold-layer tables already in use.

Which of the following terms is used to describe this data augmentation?

- A. Last-mile
- **B. Data enhancement**
- C. Data testing
- D. Ad-hoc improvements
- E. Last-mile ETL

Antwort: B

Begründung:

Data enhancement is the process of adding or enriching data with additional information to improve its quality, accuracy, and usefulness. Data enhancement can be used to augment existing data sources with new data sources, such as external datasets, synthetic data, or machine learning models. Data enhancement can help data analysts to gain deeper insights, discover new patterns, and solve complex problems. Data enhancement is one of the applications of generative AI, which can leverage machine learning to

generate synthetic data for better models or safer data sharing¹.

In the context of the question, the data analyst is working with gold-layer tables, which are curated business-level tables that are typically organized in consumption-ready project-specific databases²³⁴. The gold-layer tables are the final layer of data transformations and data quality rules in the medallion lakehouse architecture, which is a data design pattern used to logically organize data in a lakehouse². The stakeholder has provided the analyst with an additional dataset that can be used to augment the gold-layer tables already in use. This means that the analyst can use the additional dataset to enhance the existing gold-layer tables with more information, such as new features, attributes, or metrics. This data augmentation can help the analyst to complete the ad-hoc project more effectively and efficiently.

52. Frage

Which of the following approaches can be used to ingest data directly from cloud-based object storage?

- A. Create an external table while specifying the DBFS storage path to PATH
- B. Create an external table while specifying the DBFS storage path to FROM
- **C. Create an external table while specifying the object storage path to LOCATION**
- D. It is not possible to directly ingest data from cloud-based object storage
- E. Create an external table while specifying the object storage path to FROM

Antwort: C

Begründung:

External tables are tables that are defined in the Databricks metastore using the information stored in a cloud object storage location. External tables do not manage the data, but provide a schema and a table name to query the data. To create an external table, you can use the CREATE EXTERNAL TABLE statement and specify the object storage path to the LOCATION clause. For example, to create an external table named ext_table on a Parquet file stored in S3, you can use the following statement:

SQL

```
CREATE EXTERNAL TABLE ext_table (  
  col1 INT,  
  col2 STRING  
)
```

STORED AS PARQUET

LOCATION 's3://bucket/path/file.parquet'

AI-generated code. Review and use carefully. More info on FAQ.

53. Frage

In which circumstance will there be a substantial difference between the variable's mean and median values?

- A. When the variable is of the categorical type
- B. When the variable contains no outliers
- **C. When the variable contains a lot of extreme outliers**
- D. When the variable is of the boolean type

Antwort: C

Begründung:

The mean is sensitive to extreme values, often called outliers, which can significantly skew the average away from the true center of the data. The median, however, is a measure of central tendency that is resistant to such outliers because it only considers the middle value(s) when the data is ordered. Therefore, when a variable contains many extreme outliers, there will be a substantial difference between the mean and the median. According to Databricks data analysis materials, this is a fundamental concept when choosing summary statistics for reporting.

54. Frage

A data analyst runs the following command:

```
INSERT INTO stakeholders.suppliers TABLE stakeholders.new_suppliers;
```

What is the result of running this command?

- A. The suppliers table now contains both the data it had before the command was run and the data from the new suppliers table, and any duplicate data is deleted.
- **B. The command fails because it is written incorrectly.**
- C. The suppliers table now contains only the data from the new suppliers table.
- D. The suppliers table now contains both the data it had before the command was run and the data from the new suppliers table, including any duplicate data.
- E. The suppliers table now contains the data from the new suppliers table, and the new suppliers table now contains the data from the suppliers table.

Antwort: B

Begründung:

The command `INSERT INTO stakeholders.suppliers TABLE stakeholders.new_suppliers` is not a valid syntax for inserting data into a table in Databricks SQL. According to the documentation¹², the correct syntax for inserting data into a table is either: `INSERT { OVERWRITE | INTO } [ TABLE ] table_name [ PARTITION clause ] [ ( column_name [, ...] ) | BY NAME ] query` or `INSERT INTO [ TABLE ] table_name REPLACE WHERE predicate query`. The command in the question is missing the `OVERWRITE` or `INTO` keyword, and the query part that specifies the source of the data to be inserted. The `TABLE` keyword is optional and can be omitted. The `PARTITION` clause and the column list are also optional and depend on the table schema and the data source. Therefore, the command in the question will fail with a syntax error.
