It discusses security challenges like application security, cloud posture, and runtime security. Candidates will learn about technologies securing cloud environments such as Cloud Security Posture Management (CSPM) and Cloud Workload Protection Platforms (CWPP), as well as the functions of a Cloud Native Application Protection Platform (CNAPP) and features of Cortex Cloud.
Thema 3	• Cybersecurity: This section of the exam measures skills of a Cybersecurity Practitioner and covers fundamental concepts of cybersecurity, including the components of the authentication, authorization, and accounting (AAA) framework, attacker techniques as defined by the MITRE ATT&CK framework, and key principles of Zero Trust such as continuous monitoring and least privilege access. It also addresses understanding advanced persistent threats (APT) and common security technologies like identity and access management (IAM), multi-factor authentication (MFA), mobile device and application management, and email security.
Thema 4	• Security Operations: This final section measures skills of a Security Operations Analyst and covers key characteristics and practices of threat hunting and incident response processes. It explains functions and benefits of security information and event management (SIEM) platforms, security orchestration, automation, and response (SOAR) tools, and attack surface management (ASM) platforms. It also highlights the functionalities of Cortex solutions, including XSOAR, Xpanse, and XSIAM, and describes services offered by Palo Alto Networks' Unit 42.
Thema 5	• Endpoint Security: This domain is aimed at an Endpoint Security Analyst and covers identifying indicators of compromise (IOCs) and understanding the limits of signature-based anti-malware. It includes concepts like User and Entity Behavior Analytics (UEBA), endpoint detection and response (EDR), and extended detection and response (XDR). It also describes behavioral threat prevention and endpoint security technologies such as host-based firewalls, intrusion prevention systems, device control, application control, disk encryption, patch management, and features of Cortex XDR.

Palo Alto Networks Certified Cybersecurity Practitioner PCCP Prüfungsfragen mit Lösungen (Q114-Q119):

114. Frage

What are two characteristics of an advanced persistent threat (APT)? (Choose two.)

- **A. Multiple attack vectors**
- B. Reduced interaction time
- **C. Repeated pursuit of objective**
- D. Tendency to isolate hosts

Antwort: A,C

Begründung:

Multiple attack vectors - APTs often use various methods (phishing, malware, lateral movement) to infiltrate and maintain access to a target.

Repeated pursuit of objective - APTs are known for their persistent nature, involving continuous efforts over time to achieve their

goals, such as data theft or surveillance.

115. Frage

Which Palo Alto Networks tool is used to prevent endpoint systems from running malware executables such as viruses, trojans, and rootkits?

- A. Cortex XDR
- B. App-ID
- C. AutoFocus
- D. Expedition

Antwort: A

Begründung:

Cortex XDR is a cloud-based, advanced endpoint protection solution that combines multiple methods of prevention against known and unknown malware, ransomware, and exploits. Cortex XDR uses behavioral threat protection, exploit prevention, and local analysis to stop the execution of malicious programs before an endpoint can be compromised. Cortex XDR also enables remediation on the endpoint following an alert or investigation, giving administrators the option to isolate, terminate, block, or quarantine malicious files or processes. Cortex XDR is part of the Cortex platform, which provides unified visibility and detection across the network, endpoint, and cloud. References:

116. Frage

Which two workflows are improved by integrating SIEMs with other security solutions? (Choose two.)

- A. Hardware procurement
- B. Log normalization
- C. Initial security team training
- D. Incident response

Antwort: B,D

Begründung:

Log normalization - SIEMs standardize log formats from various sources, making it easier to analyze and correlate security events.
Incident response - Integration enables faster detection, investigation, and automated or guided response to security incidents by using correlated data from multiple tools.

Hardware procurement and security team training are not directly influenced by SIEM integration.

117. Frage

Layer 4 of the TCP/IP Model corresponds to which three Layer(s) of the OSI Model? (Choose three.)

- A. Network
- B. Application
- C. Transport
- D. Presentation
- E. Session

Antwort: C,D,E

Begründung:

Layer 4 of the TCP/IP model is the transport layer, which is responsible for providing reliable and efficient data transmission between hosts. The transport layer can use different protocols, such as TCP or UDP, depending on the requirements of the application. The transport layer also performs functions such as segmentation, acknowledgement, flow control, and error recovery. 1 The transport layer of the TCP/IP model corresponds to three layers of the OSI model: the transport layer, the session layer, and the presentation layer. The session layer of the OSI model manages the establishment, maintenance, and termination of sessions between

applications. The session layer also provides services such as synchronization, dialogue control, and security. The presentation layer of the OSI model handles the representation, encoding, and formatting of data for the application layer. The presentation layer also performs functions such as compression, encryption, and translation. 23 References:

118. Frage

How can local systems eliminate vulnerabilities?

- A. Test and deploy patches on a focused set of systems.
- **B. Patch systems and software effectively and continuously.**
- C. Perform an attack on local systems.
- D. Create preventative memory-corruption techniques.

Antwort: B

Begründung:

Local systems can eliminate vulnerabilities by patching systems and software effectively and continuously.

Patching is the process of applying updates or fixes to software or hardware components that have known vulnerabilities or bugs.

Patching can prevent attackers from exploiting these vulnerabilities and compromising the security or functionality of the systems.

Patching should be done regularly and promptly, as new vulnerabilities are constantly discovered and exploited by cybercriminals.

Patching should also be done effectively, meaning that the patches are tested and verified before deployment, and that they do not introduce new vulnerabilities or issues.

Patching should also be done continuously, meaning that the systems are monitored for new vulnerabilities and patches are applied as soon as they are available. Continuous patching can reduce the window of opportunity for attackers to exploit unpatched vulnerabilities and cause damage or data breaches. References:
