Practice Cisco 350-501 Exam & New 350-501 Test Format

As we all know, if the content of your exam materials is complex and confusing, then if you want to pass the exam, you will be quite worried. Our 350-501 study guide helps the candidates to easily follow the needed contents with simplified languages and skillfully explanations according the perfect designs of the professional experts. Preparing with the help of our 350-501 Exam Questions frees you from getting help from other study sources, and you can pass the exam with 100% success guarantee.

Related Certifications

- **CCNP Service Provider**

Cisco CCNP Service Provider proves your capability to implement service provider solutions. Achieving this certificate requires meticulous mastery of 350-501 exam concepts in addition to passing the concentration test of your liking. That being said, the full list of the concentration options associated with the CCNP Service Provider certification includes the following: Cisco 300-510 Implementing Cisco Service Provider Advanced Routing Solutions (SPRI), Cisco 300-515: Implementing Cisco Service Provider VPN Services (SPVI), Cisco 300-535: Implementing Automation for Cisco Service Provider Solutions (SPAUTO).

- **CCIE Service Provider**

Cisco CCIE Service Provider lies at the pinnacle of the Cisco Service Provider certification track and is exactly the step to make after attaining the CCNP Service Provider certificate. It confirms one's expert-level mastery of Service Provider technologies. To qualify for it, you must pass a combination of two exams a core 350-501 test that focuses on the fundamentals of the field and a hands-on lab exam that checks the mastery of the service provider solutions through a practical

environment. The lab exam, in this case, is CCIE Service Provider v5.0.

- **Cisco Certified Specialist – Service Provider Core**

Cisco Certified Specialist – Service Provider Core is a creation of the new Cisco curriculum which states that every professional-level exam now earns the candidates a Specialist title alongside the accreditation they are going to obtain. In a nutshell, this is a deserved recognition for your accomplishments at the professional level regardless of your further path.

Cisco Implementing and Operating Cisco Service Provider Network Core Technologies Sample Questions (Q265-Q270):

NEW QUESTION # 265

Refer to the exhibit:

□ An engineer is preparing to implement link aggregation configuration. Which statement about this configuration is true?

- A. The switch port passively negotiates an EtherChannel if it receives PAgP packets from a connected peer
- B. The switch port negotiates an EtherChannel if it receives LACP packets from a connected peer
- C. The switch port accepts LACP and PAgP packets from a connected peer and negotiate an EtherChannel using the common EtherChannel mode.
- **D. The switch port actively sends packets to negotiate an EtherChannel using PAgP**

Answer: D

Explanation:

The command `channel-group 1 mode desirable` configures the switch port to actively send PAgP packets to negotiate forming an EtherChannel. PAgP is a Cisco-proprietary protocol used in the automatic creation of EtherChannel links. When set to 'desirable', the port actively attempts to form an EtherChannel, which means it sends PAgP packets without waiting for the connected peer to initiate the negotiation.

For more information on link aggregation and EtherChannel configurations, refer to the Implementing and Operating Cisco Service Provider Network Core Technologies (SPCOR) course materials, specifically the sections covering EtherChannel and PAgP.

NEW QUESTION # 266

Which two IS-IS parameters must match before two Level 2 peers can form an adjacency? (Choose two)

- A. MTU
- **B. authentication settings**
- C. system ID
- D. area ID
- **E. hello timer setting**

Answer: B,E

Explanation:

In IS-IS, Level 2 peers must have matching authentication settings to ensure security and integrity of the routing domain. The hello timer setting must also match to ensure that the peers can maintain a consistent adjacency state. Mismatched hello timers could lead to adjacency flaps or failure to form an adjacency.

NEW QUESTION # 267

Refer to the exhibit:

□ Which three outcomes occur if the prefix list is added to the neighbor? (Choose three)

- A. 192.168 0.0/17 is permitted
- **B. 192.168.0.0/16 is denied**
- **C. 192.168 0.0/19 is denied.**
- D. 192.168 0.0/19 is permitted
- **E. 192.168 0.0/16 is permitted**
- F. 192.168 0.0/17 is denied.

Answer: B,C,E

Explanation:

When a prefix list is applied to a BGP neighbor, it filters routes based on the specified conditions. In this scenario, the prefix list is designed to permit prefixes that are equal to or longer than /17 but shorter than or equal to /19. Therefore:

A: 192.168.0.0/19 is denied because it falls outside the specified range.

D: 192.168.0.0/16 is denied as it is shorter than the minimum length of /17.

E: 192.168.0.0/16 is permitted because it is the exact prefix specified in the prefix list, and the ge and le modifiers apply to more specific routes derived from this prefix. Reference: Implementing and Operating Cisco Service Provider Network Core Technologies (SPCOR) - Cisco official courseware.

NEW QUESTION # 268

Which feature describes the weight parameter for BGP path selection?

- A. Its value is set either locally or globally.
- B. Its value is global to the router.
- **C. Its value is local to the router**
- D. Its default value is 0.

Answer: C

Explanation:

The weight parameter in BGP (Border Gateway Protocol) is a Cisco-specific attribute that is local to the router on which it is configured. It is used to prefer one path over another when multiple paths to the same destination are available. The weight is not advertised to other routers, making it a local parameter.

NEW QUESTION # 269

Refer to the exhibit.

Refer to the exhibit. Four midsize service providers provide access to different customers that use Layer 3 VPN services to enable communication across geographic regions. The service providers are connected as shown in the exhibit, and the PEs have established eBGP relationships. PE4 has an iBGP relationship with PE5. The routes that PE4 learns from PE5 must reach the other PE routers, but they are absent from the routing tables on the other PEs. Which action should the engineers take to correct the problem?

- **A. Configure a peering between all five PEs.**
- B. Disable BGP synchronization on PE4.
- C. Enable BGP IPv4 unicast on PE4 and PE5
- D. Advertise the route targets for PE5 to the other PEs

Answer: A

NEW QUESTION # 270
