Cisco Certified Support Technician (CCST) Cybersecurity Sample Questions (Q32-Q37):

NEW QUESTION # 32
The company web server collects information through a form. The form is accessed by using port 80. The form content is transferred to an encrypted database for storage. You are investigating a complaint that the form content has been compromised.
What is the cause of the security breach?

- A. The data was transferred to the database using a nonsecure protocol.
- B. The website was accessed using HTTP, which is an unencrypted protocol.
- C. The database was compromised.
- D. The web browser used to access the site was not updated to the latest version.

Answer: B

Explanation:
The CCST Cybersecurity Study Guide explains that HTTP (port 80) transmits data in cleartext, making it susceptible to interception. Even if data is stored securely in an encrypted database, sensitive information can be compromised during transmission if HTTPS (port 443) is not used.
"When HTTP is used instead of HTTPS, all form inputs and transmitted data are sent in plaintext over the network, where they can be intercepted by attackers." (CCST Cybersecurity, Basic Network Security Concepts, Secure Protocols section, Cisco Networking Academy)

NEW QUESTION # 33
Which of the following is an element of an incident response plan?

- A. Conducting regular backups
- B. Identifying vulnerabilities
- C. Installing antivirus software
- D. Developing security policies

Answer: D

Explanation:
An incident response plan outlines the steps and procedures to be followed when a cybersecurity incident occurs. One of the elements of an incident response plan is developing security policies. These policies serve as a framework for managing and

responding to security incidents.

NEW QUESTION # 34

What is a vulnerability in the context of cybersecurity?

- A. A security measure that prevents unauthorized access
- B. A weakness in a system that can be exploited by threats
- C. A software bug that causes system crashes
- D. An advanced encryption algorithm

Answer: B

Explanation:

A vulnerability refers to a weakness in a system that can be exploited by threats or attackers. It could be a flaw in software, a misconfiguration, or a gap in security controls that can be taken advantage of to gain unauthorized access, disrupt services, or compromise data. Identifying and addressing vulnerabilities is crucial to maintaining a secure cybersecurity posture.

NEW QUESTION # 35

Which technology focuses on automating security response actions based on predefined playbooks or workflows?

- A. SOAR (Security Orchestration, Automation, and Response)
- B. SIEM (Security Information and Event Management)
- C. IDS (Intrusion Detection System)
- D. Firewall

Answer: A

Explanation:

SOAR (Security Orchestration, Automation, and Response) technology is designed to automate security response actions based on predefined playbooks or workflows. These playbooks specify the steps to be taken when specific security incidents or events occur, allowing for a consistent and automated response. SOAR integrates with various security tools and systems, enabling automatic and orchestrated actions to handle security incidents effectively.

NEW QUESTION # 36

Which of the following is an example of a network vulnerability?

- A. Implementing a firewall
- B. Using a strong password
- C. Encrypting sensitive data
- D. Running outdated and unpatched software

Answer: D

Explanation:

Running outdated and unpatched software is an example of a network vulnerability. Software updates often include patches to fix security vulnerabilities that have been discovered. Failing to install these updates or using outdated software increases the risk of an attacker exploiting known vulnerabilities to gain unauthorized access or compromise the network.

NEW QUESTION # 37
