Exam Terraform-Associate-003 Syllabus - Terraform-Associate-003 Exam Questions Fee

The web-based HashiCorp Terraform-Associate-003 practice test software can be used through browsers like Firefox, Safari, and

Google Chrome. The customers don't need to download or install any excessive plugins or software in order to use the web-based HashiCorp Terraform-Associate-003 Practice Exam format. The web-based Terraform-Associate-003 practice test software format is supported by different operating systems like Mac, iOS, Linux, Windows, and Android.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q70-Q75):

NEW QUESTION # 70

Where in your Terraform configuration do you specify a state backend?

- A. The resource block
- **B. The terraform block**
- C. The data source block
- D. The provider block

Answer: B

Explanation:

In Terraform, the backend configuration, which includes details about where and how state is stored, is specified within the `terraform` block of your configuration. This block is the correct place to define the backend type and its configuration parameters, such as the location of the state file for a local backend or the bucket details for a remote backend like S3. This practice is outlined in Terraform's core documentation, which provides examples and guidelines on how to configure various aspects of Terraform's behavior, including state backends.

NEW QUESTION # 71

Why does this backend configuration not follow best practices?

- A. You should use the local enhanced storage backend whenever possible
- B. An alias meta-argument should be included in backend blocks whenever possible
- **C. You should not store credentials in Terraform configuration**
- D. The backend configuration should contain multiple credentials so that more than one user can execute `terraform plan` and `terraform apply`

Answer: C

Explanation:

This is a bad practice, as it exposes your credentials to anyone who can access your configuration files or state files. You should use environment variables, credential files, or other mechanisms to provide credentials to Terraform.

NEW QUESTION # 72

What is the best practice for securely managing sensitive values in Terraform?

- A. In a plaintext document on a shared drive.
- **B. In an HCP Terraform/Terraform Cloud variable, with the sensitive option checked.**
- **C. In a `terraform.tfvars` file, securely managed and shared with your team.**
- **D. In HashiCorp Vault.**
- E. In a `terraform.tfvars` file, checked into version control.

Answer: B,C,D

Explanation:

Detailed Explanation:

* Rationale for Correct Answers:

* C. `terraform.tfvars` securely managed: Acceptable if distributed securely outside version control.

* D. HCP Terraform/Terraform Cloud sensitive variables: Official best practice for team-based workflows.

* E. Vault: HashiCorp Vault is designed for secret management and integrates well with Terraform.

* Analysis of Incorrect Options:

* A: Storing plaintext secrets on shared drives is insecure.

* B: Checking secrets into version control is a major security risk.

* Key Concept: Sensitive values should be managed securely in Vault, HCP Terraform, or securely shared .tfvars files - never in plaintext or version control.
Reference: Terraform Exam Objective - Use Terraform to Manage Infrastructure.

NEW QUESTION # 73

Which of the following does terraform apply change after you approve the execution plan? (Choose two.)

- A. Cloud infrastructure Most Voted
- B. Terraform code
- C. The execution plan
- D. State file
- E. The .terraform directory

Answer: A,D

Explanation:

Explanation

The terraform apply command changes both the cloud infrastructure and the state file after you approve the execution plan. The command creates, updates, or destroys the infrastructure resources to match the configuration. It also updates the state file to reflect the new state of the infrastructure.

The .terraform directory, the execution plan, and the Terraform code are not changed by the terraform apply command. References = Command: apply and Purpose of Terraform State

NEW QUESTION # 74

A developer accidentally launched a VM (virtual machine) outside of the Terraform workflow and ended up with two servers with the same name. They don't know which VM Terraform manages but do have a list of all active VM IDs.

Which of the following methods could you use to discover which instance Terraform manages?

- A. Run terraform taint/code on all the VMs to recreate them
- B. Use terraform refresh/code to find out which IDs are already part of state
- C. Update the code to include outputs for the ID of all VMs, then run terraform plan to view the outputs
- D. Run terraform state list to find the names of all VMs, then run terraform state show for each of them to find which VM ID Terraform manages

Answer: D

Explanation:

The terraform state list command lists all resources that are managed by Terraform in the current state file¹. The terraform state show command shows the attributes of a single resource in the state file². By using these two commands, you can compare the VM IDs in your list with the ones in the state file and identify which one is managed by Terraform.

NEW QUESTION # 75

.....

Preparation should be convenient and authentic so that anyone, be it a working person or a student, can handle the load. But now I have to tell you that all of these can be achieved in our Terraform-Associate-003 exam preparation materials. The exam preparation materials of ActualTestsQuiz Terraform-Associate-003 are authentic and the way of the study is designed highly convenient. I don't think any other site can produce results that ActualTestsQuiz can get. That is why I would recommend it to all the candidates attempting the Terraform-Associate-003 Exam to use Terraform-Associate-003 exam preparation materials.
