If yes, getting the Apple App-Development-with-Swift-Certified-User exam questions by VCEEngine is a perfect start to your App Development with Swift Certified User Exam exam preparation.

### **Apple App Development with Swift Certified User Exam Sample Questions (Q32-Q37):**

#### **NEW QUESTION # 32**

Select the location to set this app to run on an iPhone 14 in the simulator.

#### **Answer:**

Explanation:

Explanation:

This question belongs to Xcode Developer Tools , specifically the domain for building and running an app on the iOS simulator . In Xcode, the place where you choose whether the app runs on a simulator or a connected device is the run destination / scheme destination selector in the toolbar. This control appears near the top center of the Xcode window and displays the current destination, such as a simulator model or device target. To run the app on iPhone 14 , you click that selector and choose iPhone 14 from the available simulator list. Apple's Xcode documentation describes choosing a run destination before building and running the app in Simulator or on a device.

So, for the hotspot, the correct place is the device/simulator dropdown in the top toolbar , not the preview canvas controls, not the project navigator, and not the code editor. That selector determines where the app launches when you press Run.

#### **NEW QUESTION # 33**

You have created a view which includes some formatted text:

You decide to extract this formatted text into a subview so that you can reuse the formatting for other texts.

You highlight the Text and choose Extract subview.

You refactor ExtractedView to BigGreenTextView.

You add the line let text: String to the extracted view above the body.

You replace " That ' s all folks " with a reference to text

How should you call this extracted View from the original View?

- A. BigGreenTextView(text)
- B. BigGreenTextView( " That ' s all folks " )
- C. BigGreenTextView(text: text)
- D. BigGreenTextView(text: " That ' s all folks " )

**Answer: D**

Explanation:

This question belongs to View Building with SwiftUI , specifically the domain on extracting subviews to simplify the structure of an overlarge View .

When you create a custom SwiftUI view and add a stored property like:

```
let text: String
```

that property becomes part of the view's initializer. Since the property name is text, Swift expects you to pass the value using the parameter label text: when creating the view. So the correct call is:

```
BigGreenTextView(text: "That ' s all folks ")
```

That makes B the correct answer.

Why the others are wrong:

\* A is incorrect because this is not using the expected parameter label.

\* C would only be correct if there were already another variable named text in the calling scope and you wanted to pass that variable instead of the literal string shown in the question.

\* D is incorrect because it omits the parameter label.

This is a standard SwiftUI pattern: extract reusable formatting into a separate custom View, give it an input property, and then pass the needed value through the initializer using the property label.

**NEW QUESTION # 34**

Review the code.

Note: You might need to scroll to see the entire block of code.

A breakpoint is set on line 3. When the application is run, it will stop at line 3. You need to debug the code.

Drag each debugging control from the left to the correct instruction on the right. You will receive partial credit for each correct answer

**Answer:**

Explanation:

Explanation:

This question belongs to Xcode Developer Tools , especially the objective on using debugging techniques including breakpoints and stepping controls .

When execution stops at a breakpoint on line 3, Step Over runs that line without entering into another function call, so it is the correct action for moving past line 3 while staying in the current function. Step Into is used when execution reaches line 4 and you want to enter the display(numbers) function, which takes you into the function body starting at line 8. Once inside that function, Step Out continues execution until the current function returns, which is exactly what "step out from line 8" means.

Deactivate breakpoints turns breakpoint handling off so the debugger no longer stops on active breakpoints.

Continue program execution resumes the app until the next breakpoint or until the program finishes.

So the correct control order is:

1 = Continue

2 = Deactivate breakpoints

3 = Step Over

4 = Step Into

5 = Step Out

**NEW QUESTION # 35**

Review the code snippet.

What will print after the final line of code is executed?

**Answer:**

Explanation:

Answer the question by typing in the box.

2

Explanation:

This question belongs to Swift Programming Language , specifically the objective on variable scope and shadowing .

The code first declares:

```
let even = 2
```

This creates a constant named `even` in the outer scope with the value 2.  
Inside the `for` loop, the code declares another constant with the same name:  
`let even = num * 2`

This inner `even` exists only inside the loop body. It shadows the outer `even`, which means that within the loop, the name `even` refers to the loop's local constant, not the original one. However, that inner constant goes out of scope at the end of each loop iteration. After the loop finishes, the inner `even` no longer exists. So when the final line runs:

```
print(even)
```

Swift uses the original outer constant, which is still 2.

So the output is:  
2

This question tests two important Swift concepts:

- \* Scope : where a variable or constant can be accessed

- \* Shadowing : when a local declaration temporarily hides another declaration with the same name Therefore, the correct answer is 2

.

### NEW QUESTION # 36

Review the code snippet.

□ What is the output from each `print` statement?

**Answer:**

Explanation:

Answer the question by typing in the box.

10

Explanation:

This question belongs to Swift Programming Language , specifically the domain covering structs, classes, properties, methods, and the difference between structures and classes .

The key point is that `Printer` is declared as a class :

```
class Printer {  
    var copies: Int  
    init(copies: Int) {  
        self.copies = copies  
    }  
}
```

In Swift, classes are reference types . That means when you assign one class instance to another variable, both variables refer to the same object in memory rather than creating a separate copy. Apple's Swift language guide explains that classes are passed by reference, while structures are value types. So in this code:

```
var printer1 = Printer(copies: 2)
```

```
var printer2 = printer1
```

both `printer1` and `printer2` point to the same `Printer` instance.

Next, this line changes the shared object:

```
printer2.copies = 10
```

Because `printer2` refers to the same instance as `printer1`, changing `printer2.copies` also changes `printer1.copies`. Therefore, when the code executes:

```
print(printer1.copies)
```

```
print(printer2.copies)
```

the output is 10 .

This question tests one of the most important Swift concepts: classes are reference types , while structs are value types . If `Printer` had been a struct instead of a class, the result would have been different because assignment would copy the value rather than share the same instance.
