### Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q70-Q75):

#### NEW QUESTION # 70

A company collects data from thousands of remote devices by using a RESTful web services application that runs on an Amazon EC2 instance. The EC2 instance receives the raw data, transforms the raw data, and stores all the data in an Amazon S3 bucket. The number of remote devices will increase into the millions soon. The company needs a highly scalable solution that minimizes operational overhead.

Which combination of steps should a solutions architect take to meet these requirements? (Select TWO.)

- A. Add more EC2 instances to accommodate the increasing amount of incoming data.
- B. Use Amazon Route 53 to route traffic to different EC2 instances.
- C. Use Amazon API Gateway to send the raw data to an Amazon Kinesis data stream. Configure Amazon Kinesis Data Firehose to use the data stream as a source to deliver the data to Amazon S3.
- D. Send the raw data to Amazon Simple Queue Service (Amazon SQS). Use EC2 instances to process the data.
- E. Use AWS Glue to process the raw data in Amazon S3.

**Answer: B,C**

#### NEW QUESTION # 71

A company's legacy application is currently relying on a single-instance Amazon RDS MySQL database without encryption. Due to new compliance requirements, all existing and new data in this database must be encrypted. How should this be accomplished?

- A. Create an RDS read replica with encryption at rest enabled. Promote the read replica to master and switch the application over to the new master. Delete the old RDS instance.
- B. Create an Amazon S3 bucket with server-side encryption enabled. Move all the data to Amazon S3. Delete the RDS instance.
- C. Take a snapshot of the RDS instance. Create an encrypted copy of the snapshot. Restore the RDS instance from the encrypted snapshot.
- D. Enable RDS Multi-AZ mode with encryption at rest enabled. Perform a failover to the standby instance to delete the original instance.

**Answer: C**

Explanation:

Explanation

How do I encrypt Amazon RDS snapshots?

The following steps are applicable to Amazon RDS for MySQL, Oracle, SQL Server, PostgreSQL, or MariaDB.

Important: If you use Amazon Aurora, you can restore an unencrypted Aurora DB cluster snapshot to an encrypted Aurora DB cluster if you specify an AWS Key Management Service (AWS KMS) encryption key when you restore from the unencrypted DB cluster snapshot. For more information, see [Limitations of Amazon RDS Encrypted DB Instances](#).

Open the Amazon RDS console, and then choose Snapshots from the navigation pane.

Select the snapshot that you want to encrypt.

Under Snapshot Actions, choose Copy Snapshot.

Choose your Destination Region, and then enter your New DB Snapshot Identifier.

Change Enable Encryption to Yes.

Select your Master Key from the list, and then choose Copy Snapshot.

After the snapshot status is available, the Encrypted field will be True to indicate that the snapshot is encrypted.

You now have an encrypted snapshot of your DB. You can use this encrypted DB snapshot to restore the DB instance from the DB snapshot.

#### NEW QUESTION # 72

A Solutions Architect is asked to improve the fault tolerance of an existing Python application.

The web application places 1-MB images in an S3 bucket. The application then uses a single t2.large instance to transform the image to include a watermark with the company's brand before writing the image back to the S3 bucket.

What should the Solutions Architect recommend to increase the fault tolerance of the solution?

- A. Convert the code to a Lambda function triggered by scheduled Amazon CloudWatch Events.
- B. Increase the instance size to m4.xlarge and configure Enhanced Networking.
- C. Convert the code to a Lambda function triggered by Amazon S3 events.
- D. Create an Amazon SQS queue to send the images to the t2.large instance.

**Answer: C**

#### NEW QUESTION # 73

As a part of building large applications in the AWS Cloud, the Solutions Architect is required to implement the perimeter security protection. Applications running on AWS have the following endpoints:

\* Application Load Balancer

\* Amazon API Gateway regional endpoint

\* Elastic IP address-based EC2 instances.

\* Amazon S3 hosted websites.

\* Classic Load Balancer

The Solutions Architect must design a solution to protect all of the listed web front ends and provide the following security capabilities:

\* DDoS protection

\* SQL injection protection

\* IP address whitelist/blacklist

\* HTTP flood protection

\* Bad bot scraper protection

How should the Solutions Architect design the solution?

- A. Secure the endpoints by using network ACLs and security groups and adding rules to enforce the company's requirements. Use AWS Lambda to automatically update the rules.
- B. Deploy Amazon CloudFront in front of all the endpoints. Deploy AWS WAF and AWS Shield Advanced. Add AWS WAF rules to enforce the company's requirements. Use AWS Lambda to automate and enhance the security posture.
- C. Deploy AWS WAF and AWS Shield Advanced on all web endpoints. Add AWS WAF rules to enforce the company's requirements.
- D. Deploy Amazon CloudFront in front of all the endpoints. The CloudFront distribution provides perimeter protection. Add AWS Lambda-based automation to provide additional security.

**Answer: B**

#### NEW QUESTION # 74

A company's web application is running on Amazon EC2 instances behind an Application Load Balancer. The company recently changed its policy, which now requires the application to be accessed from one specific country only.

Which configuration will meet this requirement?

- A. Configure the security group for the EC2 instances.

- B. Configure the security group on the Application Load Balancer.
- C. Configure AWS WAF on the Application Load Balancer in a VPC.
- D. Configure the network ACL for the subnet that contains the EC2 instances.

**Answer: A**
